# **Final version of SRS**

# Understanding the Problem Domain of

## **Purpose:**

Mainly, we are using database to manage inconsistency, difficult data accessing, security, reliable service, concurrent access and many such problems. Database manager is used to alter, add, update or delete the record. Here, we are making database based on Service request for civil works (like - plumbing, electrical problem, carpeting etc.) Mostly customers are not easily finding the services for their problems. Here our main purpose is to make database system is used to give customers to their needed services easily and in reliably way. This database help customers to get services for their problems in its requirements and also, they get services by good workers.

customer also can rate and give feedback for the services which they get and by the feedback, we can improve the database based on customers feedback and their requirements.

## **Intended Audience and Reading Suggestions:**

The types of readers, the document is intended for, would be the ones with problems in plumbing, electric supply/low voltage, etc.

The SRS contains all the services, organized in the form of a database/table where we can have all the details of a service whether it is pending/finished, booking date, payment details, service details, worker and customer details, contact numbers, service id, also a feedback from the customers side, where customer can rate a service on the scale of 10, also an emergency column where if the customer is in hurry state, assign a priority service to the customer, in exchange of increased payment, also there is column "suggestion", if a customer is unable to find a service he wants, the customer can put that in the suggestion column. If huge demand came to a new one, it can be added to the service section and begin servicing.

The reading sequence is depended to the type of service customer wants, so he can jump to service section that he wants, where it can choose a service and book a date for it or customer can go on with services section and then pick whichever he wants.

The rest of the SRS contains the basic functionalities of the system. Here, we are starting with the product scope and description for the company goal and brief introduction of the system. After that background readings, interview's, questionnaires and observations helps users to familiars with the system. At the end we are providing information about the list of requirements, operating environment, product functions, privileges, assumptions and business constraints.

## **Product Scope:**

Here, we have going to create service request for civil works system database. This database is very useful in application like mobile or OS application. In old days if we wish to call some electrician for electric work we have to go in market and search for the electric shop, in that there is lots of time wasted. Now, in today's world everything is superfast everyone is hoping that all the work can be done through the home via mobile or laptop.

For that we have to create one application that provides every service-related household and payment systems. We can think as corporative market also if we build such a software company that provides services like plumbing, electric problem in the house, etc. in one application and the costs are also paid through that application hence the profit of the company goes high because we know that in India 34.4% of the population is using the internet and everybody faces some issues with many services in the house. Our goal is to serve who needs the services, workers have some good amount of money and also as a company to make profit.

## **Description:**

We have created service request for civil works system database. In that database we create tables. In the first table we describe what kind of services we are providing to the customers. The second table contains recommendation, if customer cannot find the service, then he or she can recommend us to add the service in future. The third table contains the type of the services like customer wants to buy normal or fast service and it also displayed the cost for both the services. The fourth table contains customer details like phone number, address etc. The fifth table contains the payment methods like cash on delivery, online payment, etc. The sixth table contains the workers list for the services which is only for our preferences that which worker is on the duty or free. The seventh table is for service status the given service to particular worker is done or not. The eighth table contains the feedback of the customer. The ninth table contains the login information like customer\_id, password, phone number.

Service request for civil works system database is the database that can be used in application perspective or website perspective also. In today's world the real-life example of service request for civil works system is 'Urban Company' in India. 'Urban Company' has started with some barbers at first time. After that customer really wants the more services by urban company. Now onwards 'Urban Company' provides more than 15 services to the customers like repair & maintenance, home cleaning, homecare & design (Decorator), pest control, packers & movers, business services, event management, weddings & party management, health & wellness, salon, painter, Carpenter, Yoga instructor, massage, spa, makeup artists etc. Our database is fully concentrated on the customer requirements.

Our database is all about for providing services to the customers therefore the major part of the database is the service information. It contains the service\_name and service\_id. Now, the main concept is the customer requirements for that we have made one recommendation section for those customers who want us to add some new services. Services are mainly two types one is normal service and fast service. In the fast service we mainly focus on the time. If customer selects the fast service then the priority of that customer is high than the normal service but for that customer needs to pay some extra amount. We keep data for the payments through via online payment or cash after service for the worker's payment. Now for the services we have to go to the customer's home for that we have to collect some customer information like customer name, address, phone number, etc. We have to assign the different customer\_id to each customer so we can differentiate two customers with the same name.

Service status is another main concept of our database that we have to know that which service is complete or pending status that help us to schedule next services to the workers. We provide one more benefit to the customer that he/she can give feedback to us via scaling 0 to 10. From that it helps us for motivating to keep progressive and if some fault happens from our side than we can improve ourselves to provide better services. For our side the major concern is to schedule workers for the services. For that we have to maintain one table that contains information of the service\_id which was same as the service information and simultaneously the worker's name, id, service status and queued service for that worker. It helps us to assign new service to the new customer on which day or which time. For the payment to the workers, it all depends on the number of services in a day. It was clearly mentioned in the workers information that how much he/she able to earn in one day. This worker information table is private to the database owner and it cannot be shown to the customer. This database helps us to make easy track of the services and make life easier.

Our database deals with the huge number of data because it tracks and stores the customer information, service information and feedback/ Rating points. It helps customer, service providers and administration as well. Customer can see the previous history of the services, payment details, and the discount of that time. Service provider can count the number of the services, it helps them to track record of their services like time, date, service name, payment done by the customer etc. Administration can make assumption on the basis of the previous services that some service is more popular than the other one, it can help to employ a greater number of workers to that particular service.

In the Application, the interface or the UI between user and application is a crucial part. The application must run properly with less bugs and efficient payment gateways system. If the user count of the App is very high, then through Endorsements and Ads, company's revenue is increased. Also, there is feature called "Super Service" in the application, in which if a particular service has less booking count, we can shift the service to this section. It contains all the service which are currently discounted. The discount attracts customers to the app, which increases the user visiting count as well as the chances of booking of any type service in that section. Even if there is a little loss there than usual, but it is better to have something than no service at all. Worker is then asked if that discounted price is enough for him to provide the service if he agrees then the service happens if not then another worker is asked. If that service is refused by all available workers, then the "service not available" option shows up.

Regular updating the application is another aspect, like festival sales attractive opening application page, cool picture and color pages, to attract youth people, etc. Anything we can increase revenue, we should know the actual and main requirements of our customers, some are,

Giving them trusted and high qualified professionals who are best in their services.

- Providing trusted, affordable, best price to quality services to customers.
- Update data model and app system by customer's rating and feedback for services.
- We should keep in mind with the delay of the services. Giving delayed service is a scratch in company's reputation as seen by customers.
- Make special ID for all the customer who taking service many times
- For maintaining diligently work we should give them small festival bonus and treat. also, the company profit and employee's salary increment in an organized way so that employee is satisfied with this salary also it doesn't affect companies profit.

Surveys are yet another important feature, we should regulate surveys of less questions per 1-2 months, it helps the company to know, what people want, and in understanding people's concerns. Most demanded service should have maximum workers to meet the demand also less demanded services should have less workers and can be moved to the "Super Service" section if necessary.

To interact more and more with people, there is special function called "Live chat". In this, there is a pop-up chat icon at the bottom of the screen in the application window. If a user has any issues regarding the service, then there are help providers there, which would help them in the live chat session, customers can ask any query like timings, prices, or anything which he want to ask within the business scope and also call them if a customer is more comfortable in talking over Voice calls.

In present time it is difficult to find the serviceman in local areas. We do not get service provider easily; we need to have a personal contact for this and it is the total waste of time because searching a services provider by contact is very time consuming. Many companies which are providing local services does not have a user-friendly app because they can't able to store data infrastructure and proper manner where in our database, we are stored data efficiently.

Our database must handle the large numbers of the data of the customers and services providers or workers. The main concern of the database is the real-life time accurate assigning the worker to the customer. If customer wants the fast services but at that time, we don't have any worker related that service then it was disaster therefore we have taken care of this type of situation. The two solutions are possible, one is we have to take one particular worker for the fast service and second is that in the queued time we have to assign more priority to the fast services but in this there is more delay in the

normal services that is quite bad impression on our system. The market is also the part of our system because the services is all about the supply and demand thing as example in the Covid -19 time the Demand is too low because of the safety reasons then how administration able to manage the customers and as well as the service providers. In the post covid time customers wants the services but with some terms like worker should have doubly vaccinated, he/she wearing the masks and gloves all the time many more. We have to track the details of the workers like experience, vaccination details, contact number, addresses, etc. Also, admin has to track on the service details like in pending mode, completed or delayed, it helps admin to manage the next assigned services.

## Fact Finding Phase

### **Background Reading/s:**

We know that in today's life it is easy to get plumbers, handyman, electrician because of mobile apps. So here we will see how data models going to do such type of work. This type of civil service apps is first found customers from different areas as much they can and after they are going to provide their services and get rating and feedback from their customers when that particular service is provided which customer needed. And from that rating and feedback from customers they improve their data model and system.

This apps store all the detail of services and it's also allowing customer to find the service provider by their needed service and its requirements (like – someone have some minor problem whereas other side someone has critical issue) and rate of services and many other aspects of services. The key fact of this type of service apps is to they are giving high qualified and trusted professionals which works within some criteria and all this thing is done by the service provider apps and it is make things easier for customers.

Here, we need to take care of about two main things, which is service providers and the customers. All the service providers are providing their services in several areas. A particular service providers manage its entire service process for his area. Based on the above things we need to make particular data model for each (ex. services, customers, customer and service provider details, rate of service, service category, payment details, rate per hour etc.) and relate it's with each other based on its relation. This all the data models are connected to each other and made the database which useful to both customers and service provider. Main purpose of generating the app and the database is to easily and reliably provide service to customers which we can do by this type of apps.

Here, we are mainly focusing on services provided to customer by company. In India most of the company which providing local services via app or any other online resources are not an Indian company. We only have one Indian company which is named urban company, it is providing most of the basic and local services which we are needed in daily life. The platform helps customers book professional home services such as beauty services and massage therapy for both women and men, cleaning, painting, plumbing, carpentry, appliance repair, and many more. This Indian company is present in Singapore, the UAE, and Australia as well. The main motive of the company is to provide the best services and provide the jobs for the professional workers at particular work. Since its launch, the company has evolved immensely, and currently, it offers services under two verticals – Beauty & Wellness, and Home Repairs & Maintenance. Service professionals are closed to 40,000, out of which 35000 are from India on its platform.

“These individuals [service providers] are the most atomic form of business units in our society... If India needs to grow, if consumers need to benefit, they have to be empowered” - As stated by Raghav Chandra, co-founder of Urban Company.

At the beginning of the starting the urban company in 2014, customers experienced issues in finding the services they truly required. Developer of the company is trying to solve this situation. They felt that there is much more gap in how people found services and in the manner in which they connected with the service providers. After that they had a idea of establishing an all-in-one platform. At initial point of the company, they build lead-generation model but over the time Urban Company adopted a full-stack model that onboard gig workers offering them financial assistance, skills training, access to branded tools and products, and a ready-to-serve market. This model is very good for the company because it provides the quality work to the company. This idea is new for the Indian market though the founders get millions of dollars of funds from the different ventures.

This company is hiring professionals which are providing their services individually in different areas. Urban company directly connect the customers with the professionals who are best in its service. Today, Urban company has more than 50000 professionals which are providing their services in best way possible. This company provide customers to fast access services through app, multiple payment methods, option to rate services and it is giving service providers to fix their charges for a service for particular time. It has a particular work flow which we are discussing now. Urban company has their own app from which user can go through all the services which are available and services provider which are ready to give services and customer can easily get the professional for their requirement for the service. Urban company charge the customers for services by two ways. First is to fixed the charge for service and other is service without any fixed charge. By the customer’s request for services, professionals are giving the services and based on the service getting by customer, customers are giving feedback.

In current situation urban company gives their service in 30 cities of India like Agra, Ahmedabad, Bhopal, Bangalore, Indore, Jaipur, Kolkata, Mumbai, Lucknow, Vadodara, Delhi and so on the services are also available in international markets like Abu Dhabi Dubai, Sydney, Singapore.

Urban company changed his name to urban clap in January 2020 because in this huge change co-founder Abhiraj Bhal said, ‘It is important to have a globally acceptable brand’ and additional he said that ‘urban Company is a simple name with universal appeals what remains unchanged in our commitment to offering reliable and affordable service at home. This is enabled by working closely with our service partners, helping them with up-skilling, financing, insurance, product, procurement, etc.’

Millions of people are familiar with the urban company because urban company always promoting their services by TV advertisement, online advertisement, Instagram network. Because of this company target a large number of audience and promote their service. They try to turn the viewers into their client with the medium of relative advertisement on television as well Instagram network. The online advertisement is very constructive as there are billions of users on Internet using social media. The urban company uses Google ads Facebook ads and YouTube ads for marketing their business also by posting attracting content on Instagram network for attract large number of people online. Working flow of customer and service provider in urban company: -

---

## 1) Customer

Using the app, customer can go through all the list of resources and select the preferable service based on their requirements. This urban company’s app allow customer to select any service they needed and they can choose it from range of choices for that particular service. Customers

can get all the information about service provider by that app. There are multiple payment methods for customer to pay for delivered service. They can rate the any particular service by their experience and give their valuable feedback to services or service providers.

## 2) Service provider

This app is allowing service providers to fix their rate for their services. When any customer requests any service provider for service, service provider will get a request on their profile and they can accept or reject it. When service provider accept any services request, alerts are received from the customers and service provider can find if they back out from work after accepting the request.

The main challenges for this type of companies are Matching Supply and Demand, Ensuring Quality of service and User Retention. Urban company is the marketplace for finding service professionals means they need to handle both the users and the service providers that means the effort for advertise is double. The trust is the main thing of the business but here if the service provider is doing not good than that affect the company not to the service provider because it is connected with the company's name. The user retention is very major challenge because if the customer wants the plumber and check the company's plumber status if it is available but 2-3 hours delay happens then for the next time customer think direct call the plumber and through not application.

## B. List the combined Requirements gathered from Background Reading/s

- To provide services easily and reliably to customer and as fast as possible by customers mentioned requirements.
- Get all the updates of customer, services and service providers.
- Update data model and app system by customer's rating and feedback for services
- Give them trusted and high qualified professionals who are best in their services.
- Provide Different payment method to customers.
- Provide as much as services possible.
- Give category in services so customers can get their services by their requirements.
- Provide job to service provider by their skill.
- Efficiently manage customer and service provider.

## Interview/s

### 1) Interview 1

**Role Play Interview Plan**

**System: Service request for civil works system database**

**Interviewee: 1) Abhiraj Singh Bhal**

**Designation:** CEO at Urban Company

**Organization Details:** Urban Company, New Delhi

**Interviewer: 1)** Harsh Mehta    **Designation:** student at DA-IICT

**2)** Jinal Chauhan    **Designation:** student at DA-IICT

**Date:** 09/10/2021

**Time:** 15:30

**Duration:** 75 minutes

**Place:** Google Meet

**Purpose of Interview:**

To increase the number of services, improving quality of service, customer satisfaction, etc

**Agenda:**

Problems and concerns with services

Initial ideas

Follow-up actions

**Documents to be brought to the interview:**

Structured Database for managing data

---

### 2) Interview Summary 1

**System:** Service request for civil works system database

**Interviewee: 1)** Abhiraj Singh Bhal

**Designation:** CEO at Urban Company

**Organization Details:** Urban Company, New Delhi

**Interviewer: 1)** Harsh Mehta    **Designation:** student at DA-IICT

**2)** Jinal Chauhan    **Designation:** student at DA-IICT

**Date:** 09/10/2021

**Time:** 15:30

**Duration:** 75 minutes

**Place:** Google Meet

**Summary of Interview:**

To increase the number of services, improving quality of service, customer satisfaction, etc

1. Quality is the key factor, if quality is improved, so the customer is satisfied, and that customer would choose us again for another service, also customer would suggest somebody for our service
  2. The satisfied customer thus suggests others for the service, this is indirect marketing
  3. First service discount, festive offers attract customer.
  4. Giving the workers a Uniform is very important part, it increases brand value of the company
  5. Providing sanitized and clean services ensures quality and COVID guidelines
  6. Providing service rating in feedback and if is positive, the company is progressing.
  7. Workers employed should be enough so that service can be done without much delay.
  8. We must ensure affordable priced services, so that we can knockout our competitors.
  9. If all these are followed, then the customer would definitely be satisfied
- 10.** For Further Queries, reach out Anil and Anurag Joshi via email or contact no.

---

### 3) Interview 2

#### **Role Play Interview Plan**

**System:** Service request for civil works system database

**Interviewee:** Rohan dave , Ruchi dave

**Designation:** customer

**Organization Details:** customer of existing company

**Interviewer:** 1) Harsh Mehta **Designation:** student at DA-IICT

2) Jinal Chauhan **Designation:** student at DA-IICT

**Date:** 07/10/2021

**Time:** 14:30

**Duration:** 45 minutes

**Place:** Cisco webex

#### **Purpose of Interview:**

Preliminary discuss with Rohan to know their opinion for building new company which give batter services with compare to the urban company

#### **Agenda:**

Problems with security and any other concerns

Current security procedures

Initial ideas

Follow-up actions

**Documents to be brought to the interview:**

Rough plan for building new service provider company.

Urban company latest database. (As document)

---

**4) Interview 2 summary**

**System:** Service request for civil works system database

**Interviewee:** Rohan dave , Ruchi dave

**Designation:** customer

**Organization Details:** customer of existing company

**Interviewer:** 1) Harsh Mehta **Designation:** student at DA-IICT

2) Jinal Chauhan **Designation:** student at DA-IICT

**Date:** 07/10/2021                           **Time:** 14:30

**Duration:** 45 minutes                           **Place:** Cisco webex

**summary of Interview:**

Preliminary discuss with Rohan to know their opinion for building new company which give better services with compare to the urban company

1. First of all, we need to know what customer requirement and how we can give satisfy services.
2. Before building the company, we must be aware with feedback off urban company and also make some brief database about what urban company was not to do for their customer and why did customer are not satisfied with their service.
3. Make some research and then improve the quality and the system which help to give fully satisfaction to the customer with compared to urban company.
4. For giving better service the company must be hire experienced and qualified employees which Can give better services and also, they all have good sense of humour.
5. We promoting our company in all sector with the help of some famous celebrities and also giving discount on first service and putting some special offer for attract the customer.
6. Make a large network of the employee which Located in all state district and villages because of this we must be ready to operate the request and give service at less time.
7. We make special ID for all the customer and give them special gift who take our services many times.

## **5) Interview 3**

### **Role Play Interview Plan**

**System:** Service request for civil works system database

**Interviewee:** Gauri Chauhan

**Designation:** Employee of urban company

**Organization Details:** Urban company office

**Interviewer:** 1) Harsh Mehta **Designation:** student at DA-IICT

2) Jinal Chauhan **Designation:** student at DA-IICT

**Date:** 06/10/2021

**Time:** 18:30

**Duration:** 45 minutes

**Place:** Google Meet

### **Purpose of Interview:**

Improving Worker's Day at Urban Company

### **Agenda:**

Problems and concerns with workers/employees

Initial ideas

Actions to improve working environment.

### **Documents to be brought to the interview:**

Structured idea or Database for managing environment and work load of the employee.

---

## **6) Interview 3 summary**

**System:** Service request for civil works system database

**Interviewee:** Gauri Chauhan

**Designation:** Employee of urban company

**Organization Details:** Urban company office

**Interviewer:** 1) Harsh Mehta **Designation:** student at DA-IICT

2) Jinal Chauhan **Designation:** student at DA-IICT

**Date:** 06/10/2021

**Time:** 18:30

**Duration:** 45 minutes

**Place:** Google Meet

### **Summary of Interview:**

Improving Worker's Day at Urban Company

1. Workers and employees are the lifelines of the company, we should keep them always in a good mood.
  2. We should not be too strict to them in matters of arriving and departure timing 5-10 minutes late is Okay.
  3. Environment is key factor; the office should be cool and hygienic also there should be COVID guidelines followed.
  4. We should manage company's profit and employee's salary increment in an organized way so that employee is satisfied with the salary, also it doesn't affect company's profit.
  5. Small Festival Bonuses and treat for employee's doesn't affect company's profit but the employee's mood is delighted.
  6. Overall Good conversations with the head is key, Head managers should not treat them as slaves and understand the worker's concerns.
  7. These all would make an employee to enjoy and work at our company.
  8. For Further queries, contact Interviewers.
- 

## **7) Interview 4**

### **Role Play Interview Plan**

**System:** Service request for civil works system database

**Interviewee:** Alka parikh

**Designation:** Economist

**Organization Details:** DA-IICT faculty office

**Interviewer:** 1) Harsh Mehta   **Designation:** student at DA-IICT

2) Jinal Chauhan   **Designation:** student at DA-IICT

**Date:** 05/10/2021                          **Time:** 17:30

**Duration:** 65 minutes                          **Place:** Zoom

### **Purpose of Interview:**

Marketing ideas to increase Company's profit

### **Agenda:**

Problems which block paths of profit

Efficient investment and increased profit

Deals which seems affordable but also increases company's market

**Documents to be brought to the interview:**

Structured idea and managed Database for managing investment and profit of the Company

---

## 8) Interview 4 summary

**System:** Service request for civil works system database

**Interviewee:** Alka parikh

**Designation:** Economist

**Organization Details:** DA-IICT faculty office

**Interviewer:** 1) Harsh Mehta **Designation:** student at DA-IICT

2) Jinal Chauhan **Designation:** student at DA-IICT

**Date:** 05/10/2021                           **Time:** 17:30

**Duration:** 65 minutes                           **Place:** Zoom

### Summary of Interview:

Marketing ideas to increase Company's profit

1. We have to design our type of services in such a way that if a customer comes for an affordable service but is also impressed for a little high-end service and buys that instead.
2. Advertisement is the Key factor, we should advertise the services and saying that the service starts at rupees = "the cheapest service price".
3. If a customer visits the application, always offer them discounts and coupons accordingly, where the services are less – releases coupons for it to attract users.
4. Advertisement should also be in areas where there is market potential, advertising where is not good market is waste.
5. If the company is increasing, it would further get increased by sponsor and endorsements
6. The proper management of profit, investing, employee's salary is a challenge. We should see things where we can save investment, increase profit.  
E.g., service parts from a wholesale vendor.

## Questionnaire/s –

We have collected 32 responses for our SRS project through google form. Following are the outcomes of our survey with some observations and google form's structure.

If yes then which features are not good in Urban Company?

32 responses

Would you like to suggest any new feature in the platform that will serve you in a better way?

1 response

Atleast some workers should be available every time so that our time is not wasted and our work is done .

Responses **32**

## Observations

### Background Reading Observation

#### How mobile apps changed the way of working life of part time service workers?

They are actually were freelancers until this application. Now they have a stable area where they can get services and jobs more easily. Also, if a person moved to a new city, where can he get the service without knowing any worker out there. This app is a gem for that, it would provide you a quality and affordable service. Also, this apps store all the detail of services and it's also allowing customer to find the service provider by their needed service and its requirements.

The key fact of this apps is that we are giving high qualified and trusted professionals which works within some criteria and all this thing is done by the service provider apps and all these things makes "Getting a service" easier for customers.

All the efforts done by company in providing a nice service, managing workers and customer satisfaction as well as the profit of company is challenge. All the data models are connected to each other and made the database which useful to both customers and provider to manage all things properly. The second paragraph is actually based on references, it tells us the journey of the Urban Company-the only Indian service provider company. Today we all knew something about the company even if one

has not taken the service is due to their investments in Ads running on various platforms like Facebook, Instagram, YouTube, etc

### **Some prime features are:**

As for **customers**,

They can go through all the list of resources and select the service based on their requirements. This app also provides customers with a wide range/big list of services and the best service to choose from. Customers can get all the information about service provider by that app. There are multiple payment methods, also customer can rate the any particular service which they received by their experience.

As for service **providers**,

When any customer requests a worker for service, service provider will get a request on their profile and they can accept or reject it. When service provider accepts any services request, alerts are received from the customers, also a notification is sent to the company, informing that this worker is busy in that service time. Also, a customer can find if they back out from work after accepting the request.

Finally, there should not be delay, as it's like daily need service, user can go to other worker/apps.

### **Interview Observation**

All the interviews taken by the Urban Company's head peoples, employee, users and economist's Interviews are being discussed on,

- To increase the number of services, improving quality of service, customer satisfaction, etc
- Problems and concerns with services,
- Preliminary discuss with Rohan to know their opinion for building new company which give better services with compare to the urban company
- Improving Worker's Day at Urban Company,
- Marketing ideas to increase Company's profit,
- and many points,

discussion about, to improve the company in each and every prospective were a lot,

Some are,

- Quality is the factor, if quality is improved, so the customer is satisfied, and that customer would choose us again for another service, also customer would suggest somebody for our service
- The satisfied customer thus suggests others for the service, this is indirect marketing
- First service discount, festive offers attract customers
- Giving the workers a Uniform is very important part, it increases brand value of the company
- Providing sanitized and clean services ensures quality and COVID guidelines

Marketing discussions like,

- Advertisement is factor, we should advertise the services and saying that the service starts at rupees = "the cheapest service price".

- If a customer visits the application, always offer them discounts and coupons accordingly, where the services are less – releases coupons for it to attract users.
- Advertisement should also be in areas where there is market potential, advertising where is not good market is waste.

Also, well-being of service providers is must as they are the lifelines of the company, In these areas, discussion were,

- Environment is the factor; the office should be
- cool and hygienic also there should be COVID guidelines followed.
- Small Festival Bonuses and treat for employee's doesn't affect company's profit but the employee's mood is delighted.
- Overall Good conversations with the head is key, Head managers should not treat them as slaves and understand the worker's concerns

Interviews were filled with great points, which when implemented, can boost the company in all areas – profit, quality, employees.

### **Questionnaire Observation**

**A total of 32 Responses received by our survey, we reached results**

- Most Age group in survey = 15-25
- Do you interest in household services? = 90.6% interested
- If yes which service, are you looking for, most were- “regular services for AC”.
- Urban Company is the only company that provides online household services in India? Do you want a company that provides more services to compete with urban company? – 78.1 % agreed to this.
- If yes then which features are not good in Urban Company? – Most Were Waiting time for the service – 46.9 %
- Would you like to suggest a new feature in the platform, that will serve you in a better a way? – Best was = “Some workers should be available all the time so that our time is not wasted in getting the service”.

**The Responses tells us people just not want to wait for the service, it's like going to app, book a service and just get it without any delay. Also, most of them want Regular services Of AC. So, it should get started asap.**

### **Fact Finding Chart**

objective	Technique	Subject(s)	Time commitment
To get background and history of the Urban company and information about to how company is hiring professionals and also there are some brief ideas of	Background Reading	Urban company report and Work flow and history of urban company	1 day

working flow for customers and service providers in Urban company's app

Summary of all the above points	Observation	All of the above	4 hours

## **List Requirements**

- Give category in services so customers can get their services by their requirements.
- Give them trusted and high qualified professionals who are best in their services.
- Provide Different payment method to customers like online payments options (Phone Pe, Paytm, google pay) and offline payment option (Cash on service).
- Giving satisfied service to the customer.
- Update data model and app system by customer's rating and feedback for services. We have to carry the data of the customer's feedback.
- If customer trusted our company and taking many services from our company, then we have to maintain the trust by giving them special voucher or giving them some gifts or some offers.
- Be aware of timing. Give services as per time which recommend by the customer.
- For giving good service and improving rating of feedback of service it is important to higher educated and well experience employees.
- Make special ID for all the customer who taking service many times.

- Taking diligently work from employee and make a good progress.
- For maintaining diligently work we should give them small festival bonus and treat. also, the company profit and employee's salary increment in an organized way so that employee is satisfied with this salary also it doesn't affect companies profit.
- We should give advertisement in TV television, Internet, social media and also making some interested content and put it on Instagram, Facebook, and YouTube for attract large number of people.
- from the survey the company need to Maintaining their time for the service. Many people excuse that they are not satisfied with the company because of the waiting time for the service.

## **User Classes and Characteristics**

1) List User Names with a basic description of user role in the system/database

Administrator, customer and service provider are the three main users of this system.

### **Administrator: -**

Administrator can access the entire database. Administrator can be allowed to add, delete, update the customer, Administrator and service provider information or any other information from database where as customers and service provider does not have these privileges which Administrator has. Admin has privilege to add any service or delete it or it can be changing the rate and information of services where customer and services provider does not have this privilege.

### **Customers: -**

Customers can access the home page and view the details of services, category of services, services providers and information regarding services and service providers to get those services. Customer also able to change his or her profile and give the rate and feedback to services and services providers and also customer can suggest any services through feedback which needed for it. Customer only have privilege to change his or her profile, customer has not any privilege to add, delete or update any information regarding administrator, services and service providers.

### **Service provider: -**

Service provider can able to add, delete or update his or her profile. Service provider does not have any privilege to add, delete or update information of administrator and customers. Service provider can able to change information of his/her services (like – rate, charge per hour etc.) but it can't able to change any other service providers information or any other services which is not provided by his/her. Service provider can access the information of customers who request his/her for service to provide service but it has not privilege to change any customers information.

### **Electrician: -**

Electricians are responsible for inspecting, testing, repairing, installing, and modifying electrical components and systems. Electricians general work at homes, businesses, and construction sites, and generally work as contractors.

### **Plumber: -**

plumber's general purpose is to supervision, maintain the flow and drainage of water, air, and other gases by assembling, installing, and repairing pipes, fittings, and plumbing fixtures districtwide. Also Maintain and provide for the safe condition and operation of all plumbing systems in district facilities.

### **Yoga Instructor: -**

The main duty for yoga instructors is to create a curriculum and lead groups through various levels and types of yoga practice. This can include doing administrative work for the class, getting equipment together and getting to know what participating clients want and Demonstrate practice and technique according to client's requirement.

### **House Keeping: -**

In housekeeping, A Housekeeper is responsible for taking care of a building's general cleanliness to provide tidy and sanitary amenities to guests and residents. Their duties include cleaning floors, making beds and dusting surfaces throughout a home or other building.

### **Pest Control: -**

Pest control workers are responsible for inspecting buildings and the surrounding property for signs of insects, rodents and other pests. They determine which treatment is best and use the proper baits or traps to remove them. Pest control workers also create barriers to prevent insects and rodents from re-entering.

## **Operating Environment**

### **1) Hardware, Software or Connectivity Requirements**

This type of web application solves the household problems and provide a platform to make interaction between customers and service providers to deliver the desired services.

#### **Hardware requirement: -**

**At customer side** the minimum hardware requirement is that we need RAM at least 512 MB, hard disk need at least 10 GB storage and processor need at least 1 GHz speed.

**At server side** the minimum hardware requirement is that we need RAM at least 1 GB, hard disk need at least 20 GB storage and processor need at least 2 GHz speed.

#### **Software or connectivity requirement: -**

**At customer side** we need good web browser (like – google chrome, Firefox or any other browser) and as part of connectivity we need Wi-Fi or mobile internet. We also need operating system like – windows or any other equivalent operating system.

**At server side** we need APACHE web server and as part of language we need HTML or JavaScript or any PHP version so server can understand the requests. We also need pgAdmin 4 as Database server. We need web browser, connectivity and operating system same as we require at customer side.

## **2) External Interface Requirements**

There are 4 external interface requirements and all requirement need to be fulfilled at both server and customer side.

### **User Interface: -**

Initially Web based Graphical User Interface (GUI) will be provided. Here, the Web portal must be completely menu driven and user friendly. In the GUI, there are various input forms and output screens are available with help of file as per requirement. So, the different people (ex. Customers, workers, administration etc.) can see the result as per requirement.

### **Hardware Interface: -**

We know that this application completely designed on website, so we need a hardware which have faster internet connectivity and can able to host the web server. In hardware interface, it is required that our machine on which this app is running can able to run virtual software on web server and there must be a facility of future upgrade, memory storage etc.

### **Software Interface: -**

We must need APACHE server to host the website. The Software must have many functionalities or language support (like – HTML, CSS, JavaScript etc.) to make interaction between user and server. There must be any operating system (like- window, Linux etc.) and web browser (like- google chrome, Firefox etc.) which can run this type of application and their also needed stable internet connectivity.

### **Connectivity Interface: -**

Mostly all the interaction between customer and server is happen on website with HTTP protocol, so there must be support of HTTP protocol. And also, sometimes system needs to generate automated message or mails so there is need of email server as part of connectivity interface. We also need wi-fi or stable internet connectivity.

## **Product Functions**

- Login:**

If the customer is already registered then he/she have to fill the user\_id / email\_id and password for logging into the dashboard of the system. If the customer is new to platform, then he/she needs to register with contact details and new password. If the customer forgets the password, then we also provide the reset or update the password through security steps.

- Customer information checker:**

We take the information about the customer for knowing the addresses and contact details of the customer. If the customer not fill the required information field, then it shows notice that “some information may not fill by you kindly fill that information”. If the customer fill faulty value in phone number like 10- digit is must for India then it also shows notice that number is wrong and same for email id.

- **Scheduling the services:**

Our system is real time application therefore many users are online at one point of time. This may lead to clash the same services to one worker therefore system has to check that the earlier service may set first in the queue of the worker's services information and second number may set at second number in the queue.

- **Cancel the services:**

If the customer book the normal service, then he/she can cancel the service by calling the cancel services function before one hour of the requested time. If the customer book the fast service, then then he/she can cancel the service by calling the cancel services function before 30 minutes of the requested time.

- **Finish the services:**

Many workers are assigned many services at one time. System has to track the service status of all the services that are demanded by the customers. If the service in the pending mode, then we can think that, that service is not entertained by any worker but if it is completed then it shows completed in the service status and it prompted users to feedback and rating page. Whether customer fill or reject the feedback rating page, system pass that service from the worker's service information and assign next service to that particular worker.

- **Worker's payment:**

We have many workers due to demand of the service. We have to pay the monthly salaries to the workers. For that we have to calculate his/her salary according to number of services. If worker one has N number of services and N/2 number of services has the full rating in the feedback then salary = N (one service value) + N/2 (Bonus on the service). This function is only for the administration and service provider, customer has no privilege to access this function.

- **Calculate the Profit and Expenditure:**

Every time company thinks about the profit and expenditure. This function calculates the profit of the company by deducting the service provider's cut and the cost of parts needed for the service. Admin can also manage the Finance and tax management according to profit and expenditure.

- **In-app chat function:**

In the application there is a pop-up chat icon at the bottom of the screen if a user has any issue regarding the service, then there our help provider will help them in the live chat session, customers can ask any query which they want to ask and also call them if necessary.

- **Super Service:**

If a particular service has less booking count, we can shift the service to a section called super service. It contains all the service which are currently discounted, the discount attracts customers here which increases the chances of booking of that service. Even if there is loss in there than usual, but it is better to have something than no service. Worker is then asked if it would provide service is that discounted price, if agrees then the service is done.

- **Service and payment history:**

We have one service and payment history function which can store all the services history which was done by the service provider in its section. Customers have an option called customer history which has the data of service history and payment history, customers can cross-check their payments and services accordingly.

## **Privileges:**

- Price rate of the service:
  - read /update/ delete: Administrator
  - read: all the customer/service provider
- Contact details of company:
  - Read /update /delete: Administrator
  - Read: all the customer as well service provider
- Available service provider and also supporting staff:
  - read /update/ delete: service providing company like urban company (UC) which can alter the database according to the new announcement.
  - read /update: service provider/company staff
  - read: all to customer
- Service management:
  - Read /update/delete: Employees of the service providing company/ authorized staff of the company
  - Read: all the Customer/service provider
- Quick update on government policy:
  - read /update: service providing company and also the other government supporting company.
  - Read: all the customer / service provider
- Servicing status:
  - read /update/ delete: the head of service providing company and their mean staff.
  - Read: all the customer / service provider
- Special section for those who recommend company for add new service.
  - Read /update/ delete: service providing company
  - Read: all the customer as well service provider
- Feedback of the customer:
  - read /update/ delete: service providing company/main staff of the company
  - Read: all the customer as well service provider
- Important details about this service:
  - read /update / delete: service providing company/ main staff of the company
  - read/Update: Service provider as well company main staff
  - Read: call the customer as well service provider

- Complain box:
  - read /update/ delete: service providing company /main staff of the company /service provider/other government supporting company
  - read: call the customer as well service provider
- Number of customer details reason wise/number of service reason wise/available service provider reason wise/availability of tool for the service.
  - read all the customer details
  - update: only authorized by the service provider company, like example urban company (UC).

### **Assumptions:**

- Customer can request their service only through the application or by the official website of the company, so it is mandatory to give them very good and fast server which never be go down.
- Most customers love receiving free information and learning about things that impact their regular life or the lives of those around them. So, think about what our customers really want to know, and which type of information would make their lives easier we have to put it on our site or application.
- Create blogs, eBook's, emails, and videos of the services which creates the bond between users and the company as well as invokes mutual trust.
- Internet connectivity is very important for the service request.
- Make brief information about the supply and demand curve like if demand of the services is increase then we get a good profit otherwise we might be faced loss.

## **Business Constraints**

- To provide a reliable application on website from where customer and service provider can interact to each other for services and make app easy through artificial intelligence and machine learning.
- Go through the rating and feedback of the customers based on that improve the database and service information
- Price controlling for services must be important to satisfy the customer's requirement.
- Marketing strategy for the company.
- Manage the salary of employees, investment, expenditure on market effort.
- Provide a trusted and highly qualified service provider to customer.
- Make a strategy to expand the business in all over world and made the strategy which is different than other company and also made it attractive.
- Video advertisement on platform like YouTube, Instagram, Facebook and make interesting video which can catch the audience's interest.
- Solve the problems of customers and service providers to make a good and trustable relationship with customer and service provider.
- Find funds and investors for company so we can face any critical issue if occur.
- Make a different payment methods option for customers.

# Normalization and Schema Refinement

**Customer ( Customer\_id, Customer\_name, Customer\_Address , Street, Customer\_State , Country, PIN\_Code, Customer\_email\_ID , Customer\_Phone\_number ,Customer\_password )**

- Primary key : Customer\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**Services ( Service\_id , service\_name ,Cost\_of\_service ,Extra\_charges )**

- Primary key : Service\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 3) Our relation is already in 1NF.
  - 4) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 3) Our relation is already in 2NF.
  - 4) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 3) Our relation is already in 3NF.
  - 4) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**Service\_Category ( Service\_id ,Normal\_service , Fast\_service , Super\_service )**

- Primary key : Service\_id
- Foregin Key : Service\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :

  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :

- 1) Our relation is already in 3NF.
- 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**Service\_Provider\_Workers (Service\_id , Worker\_id , Worker\_name , Worker\_Phone\_number ,Worker\_ratings, Worker\_vaccination\_status )**

- Primary key : Worker\_id
- Foreign Key : Service\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**Administration ( Customer\_id ,Service\_id ,Worker\_id ,Profit ,Expandise ,Total\_Salary )**

- Primary key : Service\_id
- Foreign Key : Worker\_id, Service\_id, Customer\_id, Total\_Salary
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**Recommendation (Customer\_id ,Service\_name)**

- Primary key : Customer\_id, Service\_name
- Foreign Key : Customer\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.

- 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

### **Worker\_salary (Worker\_id ,Salary ,Bonus ,Total\_Salary )**

- Primary key : Worker\_id, Total\_Salary
- Foregine Key : Worker\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

### **Cus\_Ser\_Info (Customer\_id ,Worker\_id )**

- Primary key : Customer\_id
- Foregine Key : Customer\_id, Worker\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

### **Service\_Information (Worker\_id ,Worker\_status ,Service\_requests ,Service\_Date, Service\_Time, Service\_id ,Customer\_id )**

- Primary key : Worker\_id, Service\_id, Customer\_id
- Foregine Key : Customer\_id, Worker\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- Here, we have partial dependency between Worker\_id and Worker\_status, Service\_requests because Worker\_status,Service\_requests are decided by Worker\_id which is proper subset of

candidate key(PK) so for get rid of it we need to break down Service\_Information table into two parts like

- 2NF
  - **Worker\_Information2(Worker\_id, Worker\_status, W\_Service\_requests)**
  - **Service\_Information(Customer\_id, Service\_id, Worker\_id, Service\_Date, Service\_Time)**
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

#### **Service\_payment (Customer\_id ,Worker\_id ,Service\_id , Cost\_of\_service , Payment\_method ,Transaction\_id )**

- Primary key : Worker\_id, Service\_id, Customer\_id, Transaction\_id
- Foreign Key : Worker\_id, Service\_id, Customer\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- Here, we have partial dependency between Service\_id and Cost\_of\_service because Cost\_of\_service is decided by Service\_id which is proper subset of candidate key(PK) so for get rid of it we need to break down Service\_payment table into two parts like
- 2NF:
  - **Service\_payment(Customer\_id, Worker\_id, Service\_id, Payment method, Transaction\_id)**
  - **Service\_payment2(Service\_id, Cost\_of\_service)**
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

#### **Application\_for\_payment (Transaction\_id ,Paytm ,GooglePay ,PhonePe, Cash\_on\_service\_Direct\_cash )**

- Primary key : Transaction\_id
- Foreign Key : Transaction\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :

- 1) Our relation is already in 1NF.
- 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 3) Our relation is already in 2NF.
  - 4) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 3) Our relation is already in 3NF.
  - 4) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**Customer\_Review (Transaction\_id ,Customer\_id ,Service\_id , Worker\_id , Feedback, Rating\_out\_of\_10)**

- Primary key : Transaction\_id
- Foregine Key : Worker\_id, Service\_id, Customer\_id, Transaction\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

**History (Customer\_id ,Service\_id ,Worker\_id , Service\_Date, Service\_Time, Transaction\_id )**

- Primary key : Transaction\_id
- Foregine Key : Worker\_id, Service\_id, Customer\_id, Transaction\_id
- 1NF : Our relation is already in 1NF and there are no multiple attributes.
- 2NF : Our relation is already in 2NF because :
  - 1) Our relation is already in 1NF.
  - 2) Non-prime attribute of the table is not dependent on proper subset of primary key , so there is no partial dependency.
- 3NF : Our relation is already in 3NF because :
  - 1) Our relation is already in 2NF.
  - 2) There is no transitive dependency exists in our relation.
- BCNF : Our relation is already in BCNF because :
  - 1) Our relation is already in 3NF.
  - 2) For every functional dependency  $X \rightarrow Y$ , X is the super key of the table.

Final Relations with schema:

- **Customer** (Customer\_id, Customer\_first\_name, Customer\_last\_name, Street, Customer\_State , Country, PIN\_Code, Customer\_email\_ID , Customer\_Phone\_number ,Customer\_password )
- **Services** (Service\_id , service\_name ,Cost\_of\_service ,Extra\_charges )
- **Service\_Category** (Service\_id ,Normal\_service , Fast\_service , Super\_service )
- **Service\_Provider\_Workers** (Service\_id , Worker\_id , Worker\_name , Worker\_Phone\_number ,Worker\_ratings, Worker\_vaccination\_status )
- **Worker\_salary** (Worker\_id ,Salary ,Bonus ,Total\_Salary )
- **Administration** ( Customer\_id ,Service\_id ,Worker\_id ,Profit ,Expandiseiture ,Total\_Salary )
- **Recommendation** (Customer\_id ,Service\_name)
- **Cus\_Ser\_Info** (Customer\_id ,Worker\_id )
- **Service\_Information** (Worker\_id , Service\_Date, Service\_Time, Service\_id ,Customer\_id )
- **Worker\_Information2**(Worker\_id,Worker\_status,W\_Service\_requests)
- **Service\_payment** (Customer\_id ,Worker\_id ,Service\_id , Payment\_method ,Transaction\_id )
- **Service\_payment2** (Service\_id , Cost\_of\_service )
- **Application\_for\_payment** (Transaction\_id ,Paytm ,GooglePay ,PhonePe, Cash\_on\_service\_Direct\_cash )
- **Customer\_Review** (Transaction\_id ,Customer\_id ,Service\_id , Worker\_id , Feedback, Rating\_out\_of\_10)
- **History** (Customer\_id ,Service\_id ,Worker\_id , Service\_Date, Service\_Time, Transaction\_id )

# SQL Queries

## 1. Find all worker details of 5th, 6th & 7th highest worker salary.

- Select

```
worker_id,worker_name,worker_phone_number,worker_ratings,worker_vaccination_
status from service_provider_workers where worker_id in (SELECT worker_id
FROM worker_salary ORDER BY total_salary desc OFFSET 4 ROWS FETCH
NEXT 3 ROWS ONLY)
```

```
set search_path to cwsf_db
Select worker_id,worker_name,worker_phone_number,worker_ratings,worker_vaccination_status from service_provider_workers where worker_id in (SELECT worker_id FROM worker_salary ORDER BY total_salary desc OFFSET 4 ROWS FETCH NEXT 3 ROWS ONLY)
```

worker_id	worker_name	worker_phone_number	worker_ratings	worker_vaccination_status
8215	Harshad	9799884514	8	Yes
8235	Aparna	9799884534	9	Yes
8239	Tanu	9799884538	6	Yes

- Number of tuples – 3

## 2. Find Nth highest salary from worker salary table. As example we take 11<sup>th</sup> highest in the worker salary.

- Select \* from worker\_salary order by total\_Salary desc limit 1 offset 10

```

set search_path to cwsf_db
Select * from worker_salary order by total_Salary desc limit 1 offset 10

```

	worker_id	salary	bonus	total_salary
1	8264	55000	7000	62000

- Number of tuples – 1

### 3. Find frequency of customers for recommendation and print in decreasing order.

- `SELECT customer_id, COUNT(customer_id) AS Frequency_of_recommendation FROM Recommendation GROUP BY customer_id ORDER BY COUNT(customer_id) desc`

```

set search_path to cwsf_db
SELECT customer_id, COUNT(customer_id) AS Frequency_of_recommendation
FROM Recommendation
GROUP BY customer_id
ORDER BY COUNT(customer_id) desc

```

	customer_id	frequency_of_recommendation
1	95	2
2	68	2
3	5	1
4	91	1
5	35	1
6	13	1
7	78	1
8	49	1
9	27	1
10	51	1

- Number of tuples – 10

**4. Find the service\_id and cost of service which was paid through the payment method “Paytm”.**

- ```
select service_id,cost_of_service from application_for_payment,(select * from service_payment2 natural join service_payment) as tempra where application_for_payment.transaction_id=tempra.transaction_id and application_for_payment.paytm='Yes'
```

The screenshot shows the pgAdmin 4 interface. On the left, the 'Browser' pane displays a tree view of database objects, including Procedures, Sequences, Tables (15), and Columns (4) for the 'worker\_salary' table. The 'Tables (15)' section lists: administration, application\_for\_payment, cus\_ser\_info, customer, customer\_review, history, recommendation, service\_category, service\_information, service\_payment, service\_payment2, service\_provider\_workers, services, worker\_information2, and worker\_salary. The 'Columns (4)' section for the 'worker\_salary' table lists: worker\_id, salary, bonus, and total\_salary. On the right, the 'Query Editor' pane contains the following SQL code:

```

1 set search_path to cwsf_db
2
3 select service_id,cost_of_service from application_for_payment,
4 (select * from service_payment2 natural join service_payment) as tempra
5 where application_for_payment.transaction_id=tempra.transaction_id and application_for_payment.paytm='Yes'
6
7

```

The 'Data Output' pane shows the results of the query:

|    | service_id | cost_of_service |
|----|------------|-----------------|
| 1  | 3          | 400             |
| 2  | 20         | 500             |
| 3  | 20         | 500             |
| 4  | 1          | 100             |
| 5  | 4          | 500             |
| 6  | 18         | 500             |
| 7  | 17         | 200             |
| 8  | 8          | 800             |
| 9  | 11         | 300             |
| 10 | 5          | 1000            |

- Number of tuples – 10

**5. Find the number of services happened between any two dates.**

- ```
select * from service_information where service_date between '10/1/2020' and '1/1/2021'
```

```

set search_path to cwsf_db
select * from service_information where service_date between '10/1/2020' and '1/1/2021'

```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema with tables like administration, customer, and worker\_salary. The main area has a query editor with the above SQL code and a data output table showing 19 rows of service information.

worker_id	service_date	service_time	service_id	customer_id
11	8219	2020-12-04	11:00:00	14
12	8201	2020-11-05	16:00:00	16
13	8293	2020-11-23	12:00:00	19
14	8285	2020-11-18	11:30:00	16
15	8220	2020-12-22	15:30:00	20
16	8270	2020-10-12	15:30:00	13
17	8282	2020-12-07	15:00:00	11
18	8284	2020-10-09	15:30:00	20
19	8242	2020-10-12	16:00:00	4

- Number of tuples – 19

## 6. Find the service type which is “normal” and “super” at the same time.

- select \* from service\_category where normal\_service='Yes' and super\_service='Available'

```

set search_path to cwsf_db
select * from service_category where normal_service='Yes' and super_service='Available'

```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema with tables like administration, customer, and worker\_salary. The main area has a query editor with the above SQL code and a data output table showing 4 rows of service categories.

service_id	normal_service	fast_service	super_service
1	1 Yes	No	Available
2	4 Yes	No	Available
3	8 Yes	No	Available
4	11 Yes	No	Available

- Number of tuples – 4

**7. Display all the details of the service which is “Fast” type as well as not a super service at the same time.**

- `select * from service_payment natural join service_category where service_payment.payment_method='Online' and service_category.fast_service='Yes' and service_category.super_service='Not Available'`

The screenshot shows the pgAdmin 4 interface with a query editor window. The browser pane on the left lists various database objects like Procedures, Sequences, Tables, and Views. The Query Editor pane contains the following SQL code:

```

1 set search_path to cwsf_db
2
3 select * from service_payment natural join service_category where service_payment.payment_method='Online'
4 and service_category.fast_service='Yes'
5 and service_category.super_service='Not Available'

```

The results pane displays a table with the following data:

service_id	customer_id	worker_id	payment_method	transaction_id	normal_service	fast_service	super_service
1	5	78	8225 Online	25011	No	Yes	Not Available
2	5	54	8227 Online	25022	No	Yes	Not Available
3	2	15	8299 Online	25030	No	Yes	Not Available
4	13	6	8300 Online	25056	No	Yes	Not Available
5	14	94	8286 Online	25065	No	Yes	Not Available
6	5	30	8214 Online	25079	No	Yes	Not Available

- Number of tuples – 6

**8. Display the services which had been given bad reviews by customers. Also, display every other information of that particular service.**

- `select * from customer_review natural join service_information where customer_review.worker_id=service_information.worker_id and (feedback='Bad' or feedback='Worse')`

```

1 set search_path to cwsf_db
2
3 select * from customer_review natural join service_information
4 where customer_review.worker_ids=service_information.worker_id
5 and (feedback='Bad' or feedback='Worse')
6

```

customer_id	service_id	worker_id	transaction_id	feedback	rating_out_of_10	service_date	service_time
25	39	16	8201	25073	Bad	3	2021-02-21 11:00:00
26	20	3	8261	25074	Worse	1	2021-06-17 15:30:00
27	30	5	8214	25079	Worse	2	2020-01-24 15:00:00
28	49	13	8270	25081	Bad	4	2020-10-12 15:30:00
29	6	19	8293	25082	Worse	2	2020-07-12 09:30:00
30	71	16	8226	25083	Bad	3	2021-06-22 16:00:00
31	6	11	8282	25084	Worse	2	2020-12-07 15:00:00
32	64	11	8228	25089	Bad	4	2020-03-23 10:00:00
33	100	9	8236	25091	Bad	3	2020-04-30 12:00:00
34	9	5	8225	25098	Bad	4	2020-01-31 09:00:00

- Number of tuples - 34

## 9. Find the customers with their service's payment methods. Also show the feedback of the customer

- Select customer\_id,service\_id,feedback,paytm,googlepay,phonepe, cash\_on\_service\_direct\_cash from customer\_review natural join application\_for\_payment where customer\_review.transaction\_id = application\_for\_payment.transaction\_id

```

1 set search_path to cwsf_db
2
3 select customer_id,service_id,feedback,paytm,googlepay,phonepe,cash_on_service_direct_cash from customer_review
4 natural join application_for_payment where customer_review.transaction_id = application_for_payment.transaction_id

```

customer_id	service_id	feedback	paytm	googlepay	phonepe	cash_on_service_direct_cash
91	39	14 Just Okay	No	No	Yes	No
92	100	9 Bad	No	Yes	No	No
93	64	13 Just Okay	Yes	No	No	No
94	50	2 Very Good	No	Yes	No	No
95	88	19 Good	No	No	Yes	No
96	30	3 Very Good	No	No	No	Yes
97	58	18 Just Okay	No	No	Yes	No
98	83	3 Very Good	No	Yes	No	No
99	9	5 Bad	Yes	No	No	No
100	75	17 Very Good	No	Yes	No	No

- Number of tuples – 100

## 10. Find total number of duplicate recommended services by their names.

- `select service_name,count(*) as num_of_ser from recommendation group by service_name`

The screenshot shows the PgAdmin 4 interface. On the left, the 'Browser' pane displays a tree view of database objects, including 'Tables (15)' which is expanded to show tables like 'customer', 'customer\_review', and 'recommendation'. In the center, the 'Query Editor' pane contains the following SQL code:

```

1 set search_path to cwsf_db
2 select service_name, count(*) as num_of_ser from recommendation group by service_name
  
```

Below the query editor, the 'Data Output' tab is selected, showing the results of the query:

service_name	num_of_ser
Automobile repairs	3
Relocation ready Home	3
Tourist Guide	3
Transportation	2
exterior designer	1

A green status bar at the bottom right indicates: 'Successfully run. Total query runtime: 82 msec. 5 rows affected.'

- Number of tuples – 5

## 11. Display number of customers by for each distinct city.

- `select distinct(customer_city),count(customer_id) as no_of_customer from customer group by customer_city order by no_of_customer desc;`

```

set search_path to cwsf_db
select distinct(customer_city),count(customer_id) as no_of_customer
from customer group by customer_city order by no_of_customer desc;

```

customer_city	no_of_customer
Vishag	13
lucknow	10
Patna	9
panaji	8
chennai	7
Guwahati	7
kolkata	7
raipur	7
Bengaluru	6
amritsar	5

- Number of tuples - 10

## 12. Find worker\_id,worker\_name and worker\_vaccination\_status for those worker who is not vaccinated.

- select distinct worker\_id,worker\_name,worker\_vaccination\_status from service\_provider\_workers where worker\_vaccination\_status = 'No'

```

set search_path to cwsf_db
select distinct worker_id,worker_name,worker_vaccination_status
from service_provider_workers where worker_vaccination_status = 'No'

```

worker_id	worker_name	worker_vaccination_status
8280	Billy	No
8286	Eoin	No
8229	Jeremy	No
8279	Joe	No
8221	Nitya	No
8214	Manan	No
8292	Wayne	No
8266	chris	No
8258	Virat	No
8238	Manu	No

- Number of tuples - 10

### 13. Display top 5 worker\_id ,worker\_name and worker\_ratings by their ratings.

- `select worker_id,worker_name,worker_ratings from service_provider_workers order by worker_ratings desc limit 5;`

The screenshot shows the pgAdmin 4 interface. The left sidebar has a tree view of database objects. The main area shows a query editor with the following SQL code:

```
1 set search_path to cwsf_db
2 select worker_id,worker_name,worker_ratings
3 from service_provider_workers
4 order by worker_ratings desc limit 5;
```

The results pane displays a table with 5 rows:

worker_id	worker_name	worker_ratings
1	8223	Ramesh
2	8232	Bairstow
3	8217	Dhruv
4	8220	Kinjal
5	8241	Sulekha

A green success message at the bottom right says "Successfully run. Total query runtime: 81 msec. 5 rows affected."

- Number of tuples - 5

### 14. Find the worker's information who gets more ratings as well as bonus greater than 8000.

- `select worker_id,worker_name,bonus,service_id,worker_ratings from worker_salary natural join service_provider_workers where worker_salary.worker_id=service_provider_workers.worker_id and worker_ratings>8 and bonus >8000;`

```

1 set search_path to cwsf_db
2 select worker_id,worker_name,bonus,service_id,worker_ratings from worker_salary natural join service_provider_workers
3 where worker_salary.worker_id=service_provider_workers.worker_id and worker_ratings>8 and bonus >8000;

```

worker_id	worker_name	bonus	service_id	worker_ratings
5	Sulekha	10000	2	10
6	Ankita	10000	1	9
7	Venkatesh	9000	4	9
8	Austin	10000	13	9
9	Lawrence	10000	8	10
10	Bairstow	9000	20	9
11	Buttler	9000	16	9
12	Tanu	9000	3	9
13	Ralph	9000	19	9
14	Eugene	10000	13	9

- Number of tuples - 14

## 15. Find average rating given by customer for each worker.

- `select worker_id,avg(rating_out_of_10 ) as avg_rating from customer_review group by worker_id`

```

1 set search_path to cwsf_db
2 select worker_id,avg(rating_out_of_10 ) as avg_rating from customer_review group by worker_id

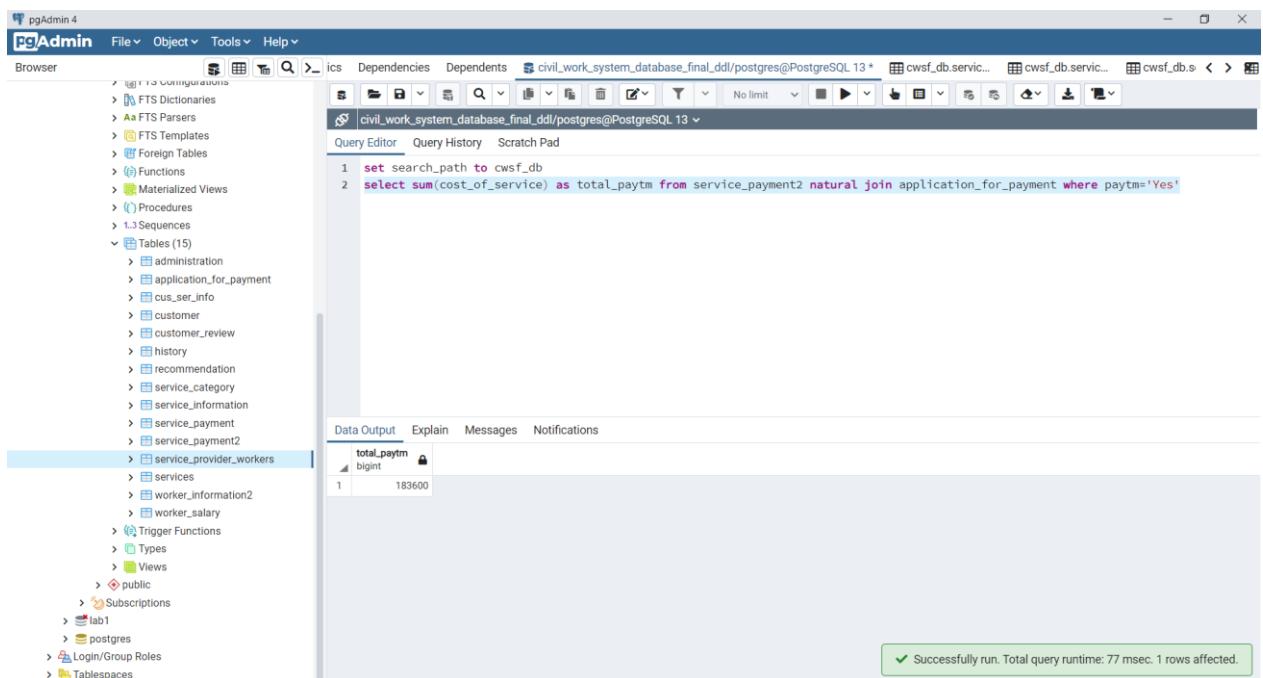

```

worker_id	avg_rating
51	8216
52	8228
53	8269
54	8261
55	8239
56	8201
57	8266
58	8220
59	8275
60	8282

- Number of tuples – 60

## 16. Find total payment we got through payment method='Paytm'.

- `select sum(cost_of_service) as total_paytm from service_payment2 natural join application_for_payment where paytm='Yes'`

The screenshot shows the pgAdmin 4 interface. On the left, the 'Browser' pane lists various database objects: Combinations, FTS Dictionaries, FTS Parsers, FTS Templates, Foreign Tables, Functions, Materialized Views, Procedures, Sequences, and Tables (15). The 'Tables' section includes administration, application\_for\_payment, cus\_ser\_info, customer, customer\_review, history, recommendation, service\_category, service\_information, service\_payment, service\_payment2, service\_provider\_workers, services, worker\_information2, and worker\_salary. Under 'Triggers', there is a Trigger Function named 'public'. The 'Subscriptions' section contains lab1 and postgres. The 'Login/Group Roles' section has a single entry. The 'Tablespaces' section is empty. The main window shows the 'Query Editor' tab with the following SQL query:

```
1 set search_path to cwsf_db
2 select sum(cost_of_service) as total_paytm from service_payment2 natural join application_for_payment where paytm='Yes'
```

The 'Data Output' tab displays the result of the query:

total_paytm
183600

A green message box at the bottom right indicates: "Successfully run. Total query runtime: 77 msec. 1 rows affected."

- Number of tuples – 1

## 17. Find the customers who take Fast services in past and show the customer\_id and customer full name

```
select customer_id, customer_first_name, customer_last_name from customer where
customer_id in (select customer_id from service_information where service_id in (select
service_id from service_category where Fast_service = 'Yes'))
```

The screenshot shows the pgAdmin 4 interface with a database browser on the left and a query editor on the right. The query editor contains the following SQL code:

```

1 set search_path to cwsf_db
2 select customer_id,customer_first_name,customer_last_name from customer where customer_id in (select customer_id
3 from service_information where service_id in
4 (select service_id from service_category where Fast_service = 'Yes'))

```

The results are displayed in a table titled "Data Output" with columns: customer\_id, customer\_first\_name, and customer\_last\_name. The data is as follows:

customer_id	customer_first_name	customer_last_name
27	Rinku	Chauhan
28	Heena	Bariya
29	Kuldeep	Rana
30	Jeremy	King
31	Ajay	Rathod
32	Peter	Young
33	Rani	Singh
34	Faizu	Goddawala
35	Richard	Gonzales

- Number of tuples - 35

## 18. Find the number of customers for each payment method.

- select payment\_method,count(\*) from service\_payment group by payment\_method

The screenshot shows the pgAdmin 4 interface with a database browser on the left and a query editor on the right. The query editor contains the following SQL code:

```

1 set search_path to cwsf_db
2 select payment_method,count(*) from service_payment group by payment_method

```

The results are displayed in a table titled "Data Output" with columns: payment\_method and count. The data is as follows:

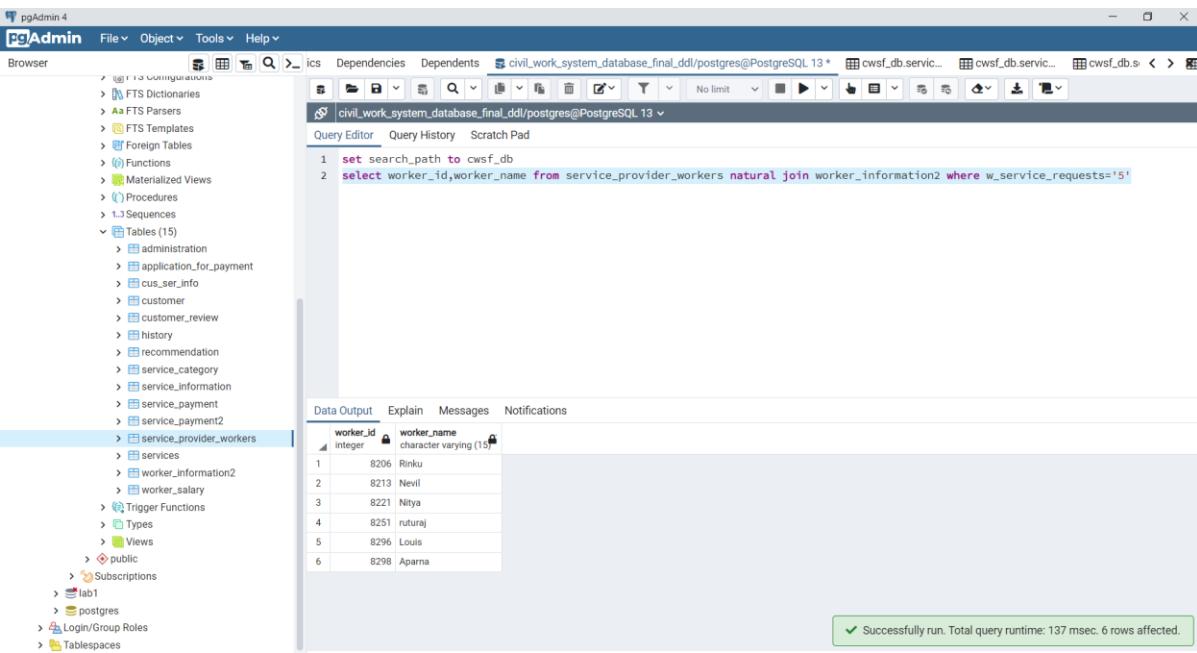

payment_method	count
Cash on Service	60
Online	40

A green message box at the bottom right indicates: "Successfully run. Total query runtime: 75 msec. 2 rows affected."

- Number of tuples – 2

## 19. Find worker's name and id who is getting maximum service requests.

- `select worker_id,worker_name from service_provider_workers natural join worker_information2 where w_service_requests='5'`

The screenshot shows the pgAdmin 4 interface with the following details:

- Browser Panel:** Shows the database schema with various tables like administration, application\_for\_payment, cus\_ser\_info, customer, customer\_review, history, recommendation, service\_category, service\_information, service\_payment, service\_payment2, service\_provider\_workers, services, worker\_information2, worker\_salary, and views.
- Query Editor:** Contains the following SQL code:
 

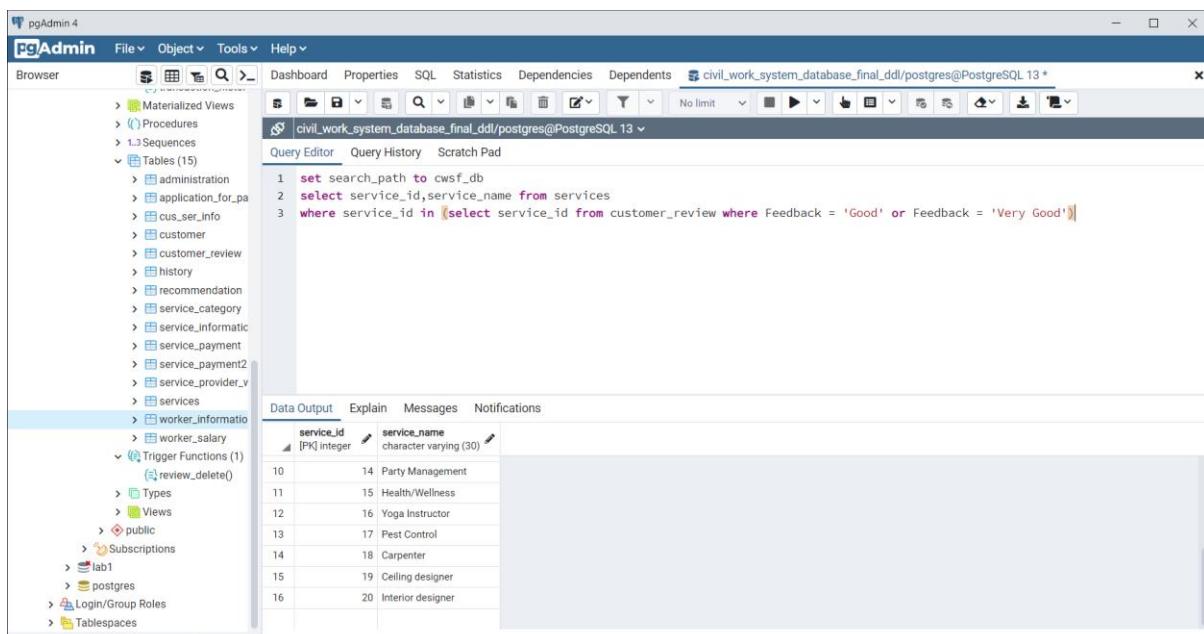

```
1 set search_path to cwsf_db
2 select worker_id,worker_name from service_provider_workers natural join worker_information2 where w_service_requests='5'
```
- Data Output:** Displays the results of the query as a table:
 

worker_id	worker_name
1	Rinku
2	Nevill
3	Nitya
4	nuraj
5	Louis
6	Aparna
- Message Bar:** Shows a green message: "Successfully run. Total query runtime: 137 msec. 6 rows affected."

- Number of tuples – 6

## 20. Find the services which has feedback ‘Good’ or ‘Very Good’.

- `select service_id,service_name from services where service_id in (select service_id from customer_review where Feedback = 'Good' or Feedback = 'Very Good')`

The screenshot shows the pgAdmin 4 interface with the following details:

- Browser Panel:** Shows the database schema with various tables like administration, application\_for\_pa, cus\_ser\_info, customer, customer\_review, history, recommendation, service\_category, service\_informatic, service\_payment, service\_payment2, service\_provider\_v, services, worker\_informatio, worker\_salary, and views.
- Query Editor:** Contains the following SQL code:
 

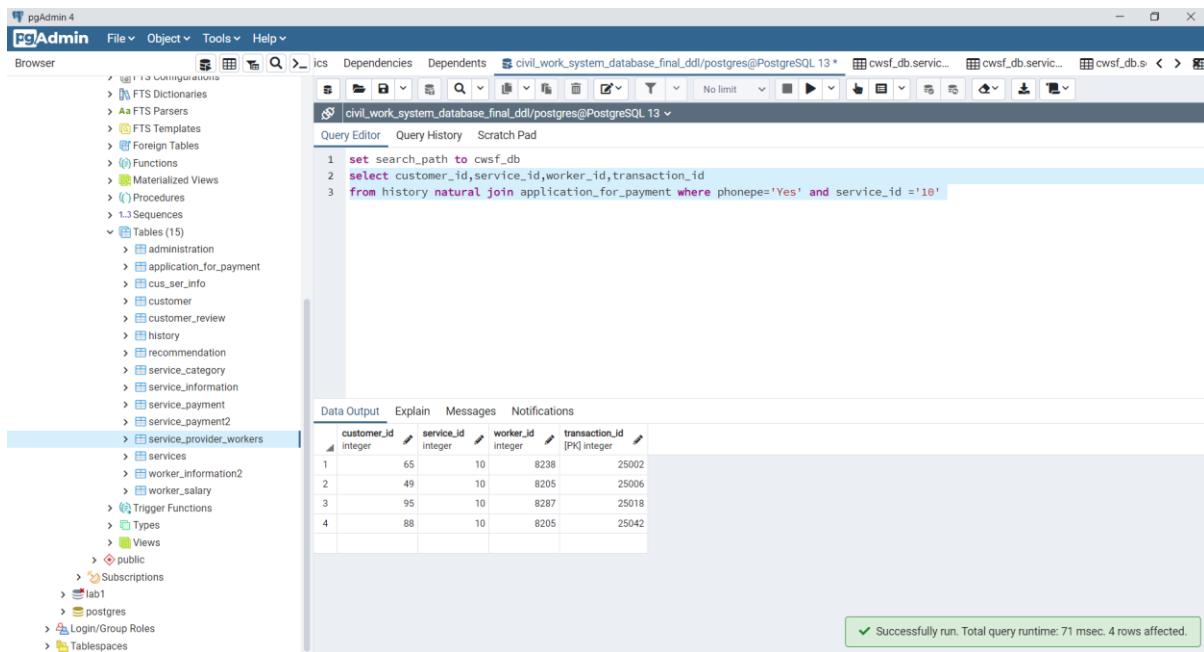

```
1 set search_path to cwsf_db
2 select service_id,service_name from services
3 where service_id in (select service_id from customer_review where Feedback = 'Good' or Feedback = 'Very Good'))
```
- Data Output:** Displays the results of the query as a table:
 

service_id	service_name
10	Party Management
11	Health/Wellness
12	Yoga Instructor
13	Pest Control
14	Carpenter
15	Ceiling designer
16	Interior designer

- Number of tuples – 16

## 21. Display customer\_id, service\_id, worker\_id and transaction\_id details for service\_id='10' and payment method is ‘phonepe’.

- `select customer_id,service_id,worker_id,transaction_id from history natural join application_for_payment where phonepe='Yes' and service_id ='10'`

```

Successfully run. Total query runtime: 71 msec. 4 rows affected.

- Number of tuples – 4

## 22. Find the workers who doesn't participate in super services with the service\_id ,worker\_id and worker\_name.

- `select worker_id,worker_name,service_id from service_provider_workers where service_id in (select service_id from service_category where Super_service='Not Available')`

```

1 set search_path to cwsf_db
2 select worker_id,worker_name,service_id from service_provider_workers
3 where service_id in (select service_id from service_category where Super_service='Not Available')

```

The screenshot shows the pgAdmin 4 interface. The left sidebar (Browser) lists database objects: FTS Configurations, FTS Dictionaries, FTS Parsers, FTS Templates, Foreign Tables, Functions, Materialized Views, Procedures, Sequences, Tables (15), administration, application\_for\_payment, cus\_ser\_info, customer, customer\_review, history, recommendation, service\_category, service\_information, service\_payment, service\_payment2, service\_provider\_workers, services, worker\_information2, worker\_salary, Trigger Functions, Types, Views, public, Subscriptions, lab1, postgres, Login/Group Roles, and Tablespaces. The main pane (Query Editor) contains the provided SQL code. The Data Output tab shows the results of the query:

worker_id	worker_name	service_id
44	8287 Aparna	10
45	8288 Radhika	14
46	8289 Vanshika	10
47	8291 Tanu	3
48	8293 Ralph	19
49	8294 Eugene	13

- Number of tuples – 8

## 24. What is the total number of efficient workers (the workers which have completed vaccination and also are rated > 6) ?

- select count(worker\_id) from service\_provider\_workers where Worker\_vaccination\_status = 'Yes' and Worker\_ratings > 6;

```

1 select count(worker_id) from service_provider_workers where Worker_vaccination_status = 'Yes' and Worker_ratings > 6;

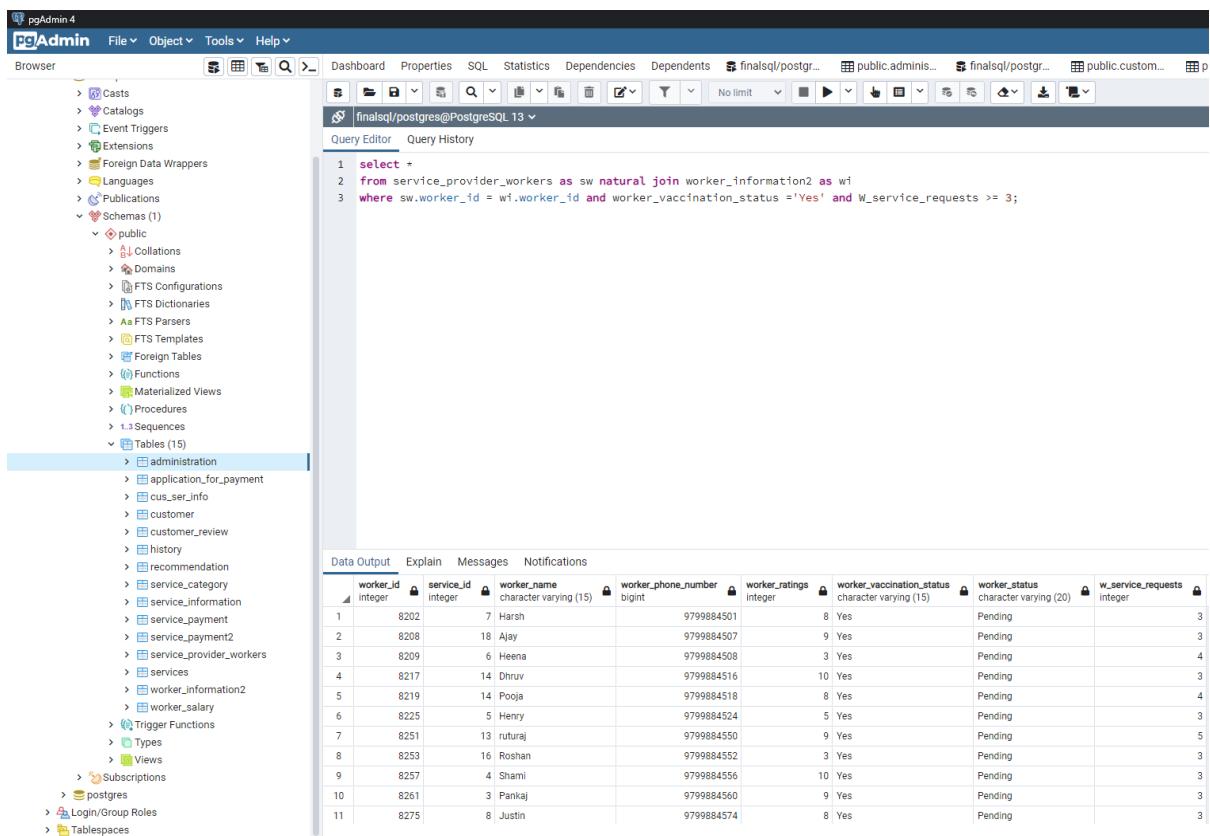

```

count	bigint
1	22

- Number of tuples – 1

## 25. Most demanding and efficient worker(which have request pending >=3 and are vaccinated)

- `select *`  
`from service_provider_workers as sw natural join worker_information2 as wi`  
`where sw.worker_id = wi.worker_id and worker_vaccination_status ='Yes' and`  
`W_service_requests >= 3;`

The screenshot shows the pgAdmin 4 interface with the following details:

- Browser:** Shows various database objects like Casts, Catalogs, Event Triggers, Extensions, Foreign Data Wrappers, Languages, Publications, Schemas, and Tables.
- Query Editor:** Contains the SQL query:
 

```
1 select *
2 from service_provider_workers as sw natural join worker_information2 as wi
3 where sw.worker_id = wi.worker_id and worker_vaccination_status ='Yes' and
W_service_requests >= 3;
```
- Data Output:** Displays the results of the query, which are 15 tuples. The columns are:
 

worker_id	service_id	worker_name	worker_phone_number	worker_ratings	worker_vaccination_status	worker_status	w_service_requests
1	8202	7 Harsh	9799884501	8	Yes	Pending	3
2	8208	18 Ajay	9799884507	9	Yes	Pending	3
3	8209	6 Heena	9799884508	3	Yes	Pending	4
4	8217	14 Dhruv	9799884516	10	Yes	Pending	3
5	8219	14 Pooja	9799884518	8	Yes	Pending	4
6	8225	5 Henry	9799884524	5	Yes	Pending	3
7	8251	13 rufuraj	9799884550	9	Yes	Pending	5
8	8253	16 Roshan	9799884552	3	Yes	Pending	3
9	8257	4 Shami	9799884556	10	Yes	Pending	3
10	8261	3 Pankaj	9799884560	9	Yes	Pending	3
11	8275	8 Justin	9799884574	8	Yes	Pending	3

- Number of tuples – 15

## 26. The service which costs the most out of all service and whose cost are greater than normal costs(700) ?

- `select service_name,Service_id,(Cost_of_service + Extra_charges) as Total_Cost`  
`from services`  
`where Cost_of_service + Extra_charges >700;`

```

select service_name,Service_id,(Cost_of_service + Extra_charges) as Total_Cost from services where Cost_of_service + Extra_charges

```

service_name	service_id	total_cost
Home Keeping	5	1120
Lawn Care	7	900
AC service/repair	8	860
Repair/Maintenance	12	800
Party Management	14	1120
Health/Wellness	15	1120
Ceiling designer	19	760

- Number of tuples - 7

## 27. The Total number of perfect worker/services – (rating = 10, feedback-very good)?

- ```
select *
from Customer_review as cr natural join worker_information2 as wi
where cr.worker_id = wi.worker_id and feedback ='Very Good' and rating_out_of_10
= 10;
```

```

1 select *
2 from Customer_review as cr natural join worker_information2 as wi
3 where cr.worker_id = wi.worker_id and feedback ='Very Good' and rating_out_of_10 = 10;

```

|    | worker_id | customer_id | service_id | transaction_id | feedback  | rating_out_of_10 | worker_status | w_service_requests |
|----|-----------|-------------|------------|----------------|-----------|------------------|---------------|--------------------|
| 1  | 8207      | 31          | 17         | 25025          | Very Good | 10               | Available     | 0                  |
| 2  | 8208      | 10          | 18         | 25048          | Very Good | 10               | Pending       | 3                  |
| 3  | 8222      | 52          | 8          | 25039          | Very Good | 10               | Not Available | 1                  |
| 4  | 8222      | 27          | 8          | 25038          | Very Good | 10               | Not Available | 1                  |
| 5  | 8224      | 83          | 3          | 25097          | Very Good | 10               | Not Available | 2                  |
| 6  | 8239      | 59          | 20         | 25008          | Very Good | 10               | Not Available | 2                  |
| 7  | 8269      | 50          | 2          | 25093          | Very Good | 10               | Available     | 0                  |
| 8  | 8269      | 61          | 2          | 25058          | Very Good | 10               | Available     | 0                  |
| 9  | 8275      | 1           | 8          | 25068          | Very Good | 10               | Pending       | 3                  |
| 10 | 8283      | 85          | 11         | 25017          | Very Good | 10               | Pending       | 3                  |

- Number of tuples - 11

## 28. The worst Performing worker (not vaccinated, less ratings and pending services <=1)?

- ```

select *
from Service_provider_workers as spw natural join worker_information2 as wi
where spw.worker_id = wi.worker_id and worker_status ='Not Available' and
w_service_requests <= 1 and worker_ratings <=5;

```

```

1 select *
2 from Service_provider_workers as spw natural join worker_information2 as wi
3 where spw.worker_id = wi.worker_id and worker_status ='Not Available' and w_service_requests <= 1 and worker_ratings <=5;

```

The screenshot shows the pgAdmin 4 interface. The left sidebar is titled 'Browser' and lists various database objects under 'Schemas (1)'. The 'Tables (15)' section is expanded, showing 15 tables. The 'Tables (15)' section is highlighted with a blue bar at the bottom. The main area contains a 'Query Editor' tab with the above SQL query and a 'Data Output' tab showing the results of the query.

	worker_id	service_id	worker_name	worker_phone_number	worker_ratings	worker_vaccination_status	worker_status	w_service_requests
1	8210	20	Vishvaraj	9799884509	3	Yes	Not Available	1
2	8231	12	Guptill	9799884530	3	No	Not Available	1
3	8234	3	Eoin	9799884533	3	Yes	Not Available	1
4	8262	17	Dhwan	9799884561	5	Yes	Not Available	1
5	8264	8	Jimmy	9799884563	3	Yes	Not Available	1
6	8271	15	shrey	9799884570	3	Yes	Not Available	1
7	8278	3	Dylan	9799884577	5	Yes	Not Available	1

- Number of tuples – 7

## 29. Total number of Vaccinated and not vaccinated worker?

- ```

select (select count(worker_vaccination_status) from service_provider_workers where
worker_vaccination_status ='Yes'
) as vaccinated,
(select
count(worker_vaccination_status) from service_provider_workers where
worker_vaccination_status ='No') as not_vaccinated,
(
    select count(worker_id) from service_provider_workers
) as Total_workers;

```

```

1 select (
2     select count(worker_vaccination_status) from service_provider_workers where worker_vaccination_status = 'Yes'
3 ) as vaccinated,
4 (select
5     count(worker_vaccination_status) from service_provider_workers where worker_vaccination_status = 'No') as not_vaccinated,
6 (
7     select count(worker_id) from service_provider_workers
8 ) as Total_workers;

```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema with various objects like Schemas, Tables, and Functions. The main area is the Query Editor containing the provided SQL code. Below the editor is a Data Output table with three columns: vaccinated, not\_vaccinated, and total\_workers, all showing the value 50.

|   | vaccinated | not_vaccinated | total_workers |
|---|------------|----------------|---------------|
| 1 | 50         | 50             | 100           |

- Number of tuples – 1

### 30. Services which lead to a complete loss for the company (profit – expenditure-salary)?

- `select worker_id, customer_id, (profit-expenditure-total_salary) as Net_Profit from administration where profit-expenditure-total_salary < 0;`

```

1 select worker_id, customer_id, (profit-expenditure-total_salary) as Net_Profit
2 from administration
3 where profit-expenditure-total_salary < 0;

```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema. The main area is the Query Editor containing the provided SQL code. Below the editor is a Data Output table with three columns: worker\_id, customer\_id, and net\_profit. The data shows six rows where the net profit is negative.

|   | worker_id | customer_id | net_profit |
|---|-----------|-------------|------------|
| 1 | 8215      | 15          | -5786      |
| 2 | 8220      | 20          | -460       |
| 3 | 8235      | 35          | -515       |
| 4 | 8251      | 51          | -203       |
| 5 | 8263      | 63          | -3530      |
| 6 | 8266      | 66          | -2473      |

- Number of tuples – 6

### 31. Total number of online vs the total number of offline services in the past 100 services?

- ```
select (
  select count(Payment_method) from service_payment where Payment_method = 'Online'
) as Internet_payment,
(
  select count(Payment_method) from service_payment where Payment_method = 'Cash on Service'
) as Cash_Payment,
(
  select count(Transaction_id) from service_payment
) as Total_workers;
```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema with various objects like Casts, Catalogs, Event Triggers, Extensions, Foreign Data Wrappers, Languages, Publications, Schemas, and Tables. The 'Tables' section under 'Schemas (1)' is currently selected, showing 15 tables including administration, application\_for\_payment, cus\_ser\_info, customer, and customer\_review. The main area is the 'Query Editor' containing the following SQL code:

```
1 select (
2   select count(Payment_method) from service_payment where Payment_method = 'online'
3 ) as Internet_payment,
4 (
5   select count(Payment_method) from service_payment where Payment_method = 'Cash on Service'
6 ) as Cash_Payment,
7 (
8   select count(Transaction_id) from service_payment
9 ) as Total_workers;
```

Below the Query Editor is the 'Data Output' tab, which displays the results of the query:

	internet_payment	cash_payment	total_workers
1	40	60	100

- Number of tuples – 1

### 32. The wrong time services, service at breakfast or lunch times?

- ```
select worker_id, customer_id, service_time, service_date
from service_information
where service_time = '12:00:00' or service_time = '9:00:00'
```

The screenshot shows the pgAdmin 4 interface. In the left sidebar, under 'MyServer (1) / PostgreSQL 13 / finalsql', the 'Tables (15)' node is selected. The right pane displays a query editor with the following SQL code:

```

1 select worker_id, customer_id, service_time, service_date
2 from service_information
3 where service_time = '12:00:00' or service_time = '9:00:00';

```

Below the query editor is a data grid titled 'Data Output' showing the results of the query. The columns are:

|    | worker_id | customer_id | service_time | service_date |
|----|-----------|-------------|--------------|--------------|
| 1  | 8234      | 15          | 12:00:00     | 2020-12-01   |
| 2  | 8249      | 8           | 09:00:00     | 2020-03-25   |
| 3  | 8283      | 85          | 12:00:00     | 2021-01-01   |
| 4  | 8287      | 95          | 09:00:00     | 2020-02-14   |
| 5  | 8274      | 11          | 12:00:00     | 2020-04-13   |
| 6  | 8263      | 7           | 09:00:00     | 2020-06-03   |
| 7  | 8299      | 15          | 12:00:00     | 2020-05-19   |
| 8  | 8282      | 27          | 12:00:00     | 2021-04-27   |
| 9  | 8279      | 35          | 12:00:00     | 2021-07-31   |
| 10 | 8269      | 61          | 12:00:00     | 2020-06-30   |
| 11 | 8293      | 71          | 12:00:00     | 2021-01-03   |
| 12 | 8243      | 72          | 12:00:00     | 2020-06-03   |
| 13 | 8286      | 94          | 12:00:00     | 2020-08-08   |

- Number of tuples – 19

### 33. Irresponsible workers – workers which are not available yet they have services to be done ?

- ```

select *
from worker_information2
where (worker_status = 'Pending' or worker_status = 'Not Available')
and w_service_requests >= 2;

```

```

1 select *
2 from worker_information
3 where (worker_status = 'Pending' or worker_status = 'Not Available')
4 and w_service_requests >=2;

```

worker_id	worker_status	w_service_requests
1	Pending	4
2	Pending	3
3	Not Available	2
4	Pending	5
5	Pending	3
6	Pending	4
7	Pending	5
8	Pending	3
9	Pending	3
10	Pending	4
11	Pending	5
12	Not Available	2
13	Pending	3
14	Not Available	2
15	Pending	4
16	Pending	3
17	Not Available	2
18	Pending	3
19	Not Available	2
20	Pending	4
21	Not Available	2
22	Not Available	2
23	Not Available	2
24	Not Available	2

- Number of tuples – 53

#### 34. Services which are categorized in ‘Super’(services in discount) but yet are expensive(>500)?

```

• select service_id,service_name,(cost_of_service + extra_charges)
as Total_cost,normal_service,fast_service,super_service
from services natural join service_category
where (cost_of_service + extra_charges)>500 and super_service ='Available';

```

```

1 select service_id,service_name,(cost_of_service + extra_charges)
2 as Total_cost,normal_service,fast_service,super_service
3 from services natural join service_category
4 where (cost_of_service + extra_charges)>500 and super_service ='Available';

```

service_id	service_name	total_cost	normal_service	fast_service	super_service
1	Plumber	620	Yes	No	Available
2	Lawn Care	900	No	Yes	Available
3	AC service/repair	860	Yes	No	Available
4	Repair/Maintenance	800	No	Yes	Available
5	Health/Wellness	1120	No	Yes	Available

- Number of tuples - 5

### 35. All the details of the service which are successfully and safely done (less expensive <500, worker vaccinated, good rating, feedback)?

- ```
select service_id, customer_id, worker_id, service_date, service_time, cost_of_service, extra_charges, worker_name, worker_ratings
from history natural join services natural join service_provider_workers
where worker_ratings>=6 and worker_vaccination_status='Yes' and
(cost_of_service+extra_charges)<500;
```

```
1 select service_id, customer_id, worker_id, service_date, service_time, cost_of_service, extra_charges, worker_name, worker_ratings
2 from history natural join services natural join service_provider_workers
3 where worker_ratings>=6 and worker_vaccination_status='Yes' and (cost_of_service+extra_charges)<500;
```

| service_id | customer_id | worker_id | service_date | service_time | cost_of_service | extra_charges | worker_name  | worker_ratings |
|------------|-------------|-----------|--------------|--------------|-----------------|---------------|--------------|----------------|
| 1          | 1           | 97        | 8233         | 3/24/2020    | 4:00 PM         | 100           | O Buttler    | 7              |
| 2          | 1           | 22        | 8233         | 10/5/2020    | 11:30 AM        | 100           | O Buttler    | 7              |
| 3          | 11          | 79        | 8282         | 1/24/2020    | 3:30 PM         | 300           | 160 Gabriel  | 10             |
| 4          | 11          | 27        | 8282         | 4/27/2021    | 12:00 PM        | 300           | 160 Gabriel  | 10             |
| 5          | 3           | 45        | 8261         | 11/28/2020   | 3:00 PM         | 400           | 80 Pankaj    | 9              |
| 6          | 1           | 42        | 8233         | 10/7/2020    | 10:00 AM        | 100           | O Buttler    | 7              |
| 7          | 13          | 6         | 8300         | 5/7/2021     | 11:00 AM        | 100           | 80 Venkatesh | 6              |
| 8          | 3           | 20        | 8261         | 6/17/2021    | 3:30 PM         | 400           | 80 Pankaj    | 9              |
| 9          | 16          | 63        | 8285         | 11/18/2020   | 11:30 AM        | 200           | 80 Buttler   | 9              |
| 10         | 11          | 6         | 8282         | 12/7/2020    | 3:00 PM         | 300           | 160 Gabriel  | 10             |
| 11         | 1           | 100       | 8233         | 2/23/2020    | 4:00 PM         | 100           | O Buttler    | 7              |

- Number of tuples – 11

### 36. The extra investment of the company (bonus percentage in total\_salary)?

```
• select
( select sum(bonus) from worker_salary
)as Total_bonus,
(
    select sum(Total_salary) from worker_salary
)as Total_investment,
(
    select (cast (sum(bonus) as float)/(cast(sum(Total_salary) as float))*100) from
worker_salary
)as Bonus_percentage;
```

The screenshot shows the pgAdmin 4 interface. The left sidebar is titled 'Browser' and lists 'MyServer (1)' which contains 'PostgreSQL 13' and 'finalsql'. The 'finalsql' database is expanded to show 'Casts', 'Catalogs', 'Event Triggers', 'Extensions', 'Foreign Data Wrappers', 'Languages', 'Publications', 'Schemas (1)', 'public', and 'Collations', 'Domains', 'FTS Configurations', 'FTS Dictionaries', 'FTS Parsers', 'FTS Templates', and 'Version Tables'. The right panel has tabs for 'Properties', 'SQL', 'Statistics', 'Dependencies', 'Dependents', and 'finalsql/postgres@PostgreSQL 13 \*'. The 'Query Editor' tab is active, displaying the following SQL code:

```

1 select
2   ( select sum(bonus) from worker_salary
3     ) as Total_bonus,
4   (
5     select sum(Total_salary) from worker_salary
6   ) as Total_investment,
7   (
8     select (cast (sum(bonus) as float)/(cast(sum(Total_salary) as float))*100) from worker_salary
9   ) as Bonus_percentage;

```

The 'Data Output' tab shows the results of the query:

|   | total_bonus | total_investment | Bonus_percentage   |
|---|-------------|------------------|--------------------|
| 1 | 623000      | 4993000          | 12.477468455838174 |

- Number of tuples – 1

### 37. Create function which will display history of services and its payment details.

- set search\_path to cwsf\_db

```

CREATE OR REPLACE function transaction_history()
RETURNS TABLE (a integer,b integer,c integer,d character varying(20),e character
varying(20),f integer,g integer)
LANGUAGE 'plpgsql'
AS $BODY$
BEGIN
return query execute format('select * from history natural join service_payment2');
END;
$BODY$;

```

```
select transaction_history()
```

```

1 set search_path to cwsf_db
2 CREATE OR REPLACE function transaction_history()
3 RETURNS TABLE (a integer,b character varying(20),c character varying(20),d character varying(20),e character varying(20),f integer,g integer)
4 LANGUAGE 'plpgsql'
5 AS $BODY$
6 BEGIN
7 return query execute format('select * from history natural join service_payment2');
8 END;
9 $BODY$;
10 select transaction_history();

```

Data Output Explain Messages Notifications

| transaction_history | record                                       |
|---------------------|----------------------------------------------|
| 1                   | (3,15,8234,12/1/2020,'12:00 PM',25000,400)   |
| 2                   | (7,44,8202,3/22/2020,'3:30 PM',25001,800)    |
| 3                   | (10,65,8238,3/5/2020,'10:00 AM',25002,400)   |
| 4                   | (20,8,8249,3/25/2020,'9:00 AM',25003,500)    |
| 5                   | (4,42,8260,2/24/2021,'9:30 AM',25004,500)    |
| 6                   | (1,82,8256,10/16/2021,'4:00 PM',25005,100)   |
| 7                   | (10,49,8205,5/14/2021,'9:30 AM',25006,400)   |
| 8                   | (20,11,8237,11/21/2020,'10:00 AM',25007,500) |

Successfully run. Total query runtime: 86 msec. 100 rows affected.

- Number of tuples – 8

### 38. Create function which will display worker's vaccination status with worker\_id.

- set search\_path to cwsf\_db

```

CREATE OR REPLACE function Get_vaccination_status()
RETURNS TABLE (d integer,e character varying(30),b character varying(30))
LANGUAGE 'plpgsql'
AS $BODY$
BEGIN
RETURN QUERY EXECUTE format ('select
worker_id,worker_name,worker_vaccination_status from
"cwsf_db".service_provider_workers');
END;
$BODY$;

```

```
select Get_vaccination_status()
```

```

1 set search_path to cwsf_db
2 CREATE OR REPLACE function Get_vaccination_status()
3 RETURNS TABLE (d integer,e character varying(30),b character varying(30))
4 LANGUAGE 'plpgsql'
5 AS $BODY$
6 BEGIN
7 RETURN QUERY EXECUTE format ('select worker_id,worker_name,worker_vaccination_status from "cwsf_db".service_provider_workers');
8 END;
9 $BODY$;
10 select Get_vaccination_status();

```

|   | record             |
|---|--------------------|
| 1 | (8201,Harshal,No)  |
| 2 | (8202,Harsh,Yes)   |
| 3 | (8203,Faizu,Yes)   |
| 4 | (8204,Ganpat,No)   |
| 5 | (8205,Nitya,No)    |
| 6 | (8206,Rinku,No)    |
| 7 | (8207,Mahipal,Yes) |
| 8 | (8208,Ajay,Yes)    |
| 9 | (8209,Hanifa,Yes)  |

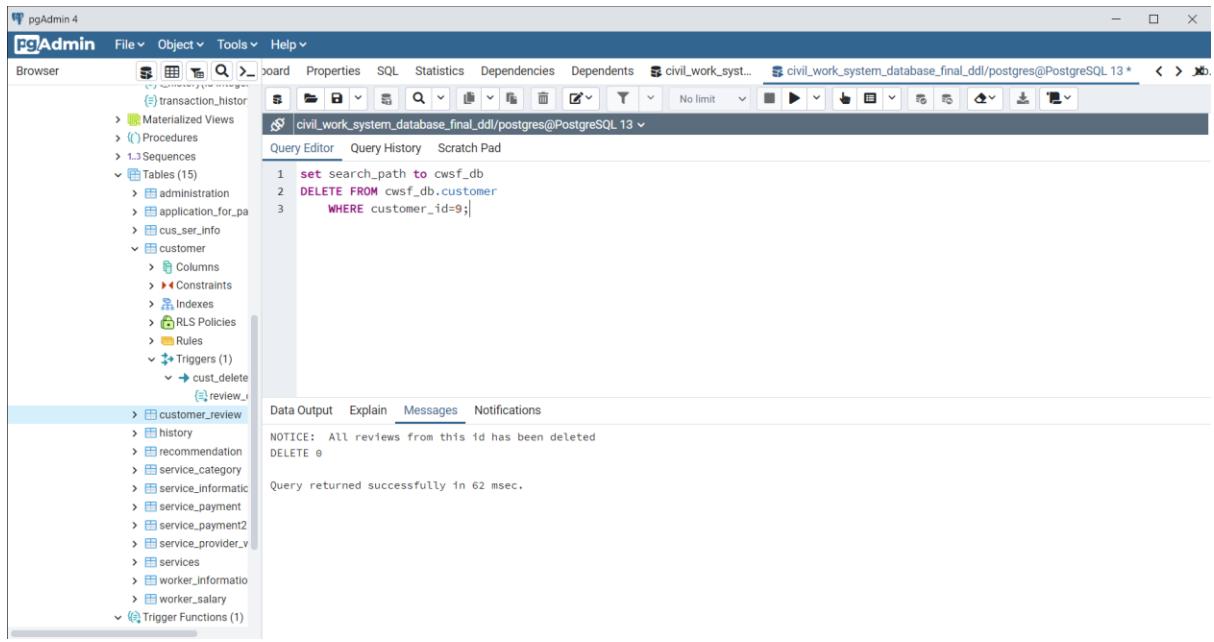

- Number of tuples – 100

### 39. Create a trigger function that delete the reviews of the customer as soon as anyone delete the customer from customer table.

- ```

CREATE OR REPLACE FUNCTION cwsf_db.review_delete()
RETURNS trigger
LANGUAGE 'plpgsql'
VOLATILE
COST 100
AS $BODY$
declare cid bigint;
begin
select "customer_id" into cid from cwsf_db.customer where
"customer_id" = old."customer_id";
if(cid = old."customer_id") then
delete from cwsf_db.customer_review
where customer_id = cid;
raise notice 'All reviews from this id has been deleted';
return null;
else
raise notice 'Reviews from this ID does not exist';
return null;
end if; end

```

## 40. Create a store procedure for inserting services in service table

- `set search_path to cwsf_db`  
`CREATE OR REPLACE PROCEDURE "cwsf_db".insert_in_services(
 service_id integer,
 service_name character varying(30), cost_of_service integer ,extra_charges integer)
LANGUAGE 'plpgsql'`  
`AS $BODY$`  
`BEGIN`  
`INSERT INTO "cwsf_db".services(service_id,
 service_name,cost_of_service,extra_charges) values (service_id,
 service_name,cost_of_service,extra_charges);`  
`COMMIT;`  
`END`  
`$BODY$;`  
`CALL "cwsf_db".insert_in_services(21, 'Driving Services',900,300);`

The screenshot shows the PgAdmin 4 interface. On the left is a tree-based database browser showing schema objects like cus\_ser\_info, customer, customer\_review, history, recommendation, service\_category, service\_informatic, service\_payment, service\_payment2, service\_provider\_v, services, worker\_informatio, worker\_salary, review\_delete(), Types, Views, public, Subscriptions, lab1, and postgres. On the right is a query editor window titled 'civil\_work\_system\_database\_final\_ddl/postgres@PostgreSQL 13'. The query is:

```
1 set search_path to cwsf_db
2 CREATE OR REPLACE PROCEDURE "cwsf_db".insert_in_services(
3     service_id integer,
4     service_name character varying(30), cost_of_service integer ,extra_charges integer)
5 LANGUAGE 'plpgsql'
6 AS $BODY$
7 BEGIN
8     INSERT INTO "cwsf_db".services(service_id, service_name,cost_of_service,extra_charges) values (service_id, service_name,cost_of_si
9     COMMIT;
10    END;
11 $BODY$;
12 CALL "cwsf_db".insert_in_services(21, 'Driving Services',900,300);
```

Below the query editor are tabs for Data Output, Explain, Messages, and Notifications. The Messages tab shows the message: 'Query returned successfully in 49 msec.'

# **Section7**

# **Project Code with output screenshots**

## Code and Snapshots:

We are implementing our database in html and python. Here, we are providing important codes only because there are many templates.

Code for this: -

Html and CSS file:

```
<!DOCTYPE html>

<html lang="en" dir="ltr">
  <head>
    <meta charset="utf-8">
    <title>Services | Home</title>
    <style>
      * {
        box-sizing: border-box;
      }

      body {
        margin: 0px;
        font-family: -apple-system, BlinkMacSystemFont, 'Segoe UI', Roboto, Oxygen, Ubuntu,
        Cantarell, 'Open Sans', 'Helvetica Neue', sans-serif;
      }

      header h1 {
        text-align: center;
        font-size: 40px;
        color: white;
      }

      header {
        padding: 40px;
        background-color: rgb(17, 124, 143);
      }
```

```
nav {  
    background-color: #333;  
    overflow: hidden;  
}  
  
nav a {
```

```
    text-decoration: none;  
    padding: 20px;  
    text-align: center;  
    float: left;  
    color: white;  
}  
  
main {
```

```
    background-color: white;  
    text-align: center;  
}
```

```

**The Owners**

Mainly, we are using database to manage inconsistency, difficult data accessing, security, reliable service, concurrent access and many such problems. Database manager is used to alter, add, update or delete the record.

Here, we are making database based on Service request for civil works (like - plumbing, electrical problem, carpeting etc.) Mostly customers are not easily finding the services for their problems. Here our main purpose is to make database system is used to give customers to their needed services easily and in reliable way. This database help customers to get services for their problems in its requirements and also, they get services by good workers. customer also can rate and give feedback for the services which they get and by the feedback, we can improve the database based on customers feedback and their requirements.

Here, we make one website named the Indian Service Company. It provides the basic operations like Home, Services, Workers, Payment, History, Contact us. For simplicity we make one button for database named “Move to Tables”. It provides three main features Show the table information, Edit the table option that provides the update, insert, delete and many more and last Custom query that we wish to compile in postures SQL.

## Functionalities snapshots:

In the below image it shows the customer's table information. Here we can see the select table options that provides the list of the tables. If we want to see table information then we have to click on that table name. Next snapshot prove that the information is same for both the snapshots.

customer_phone_number	pin_code	customer_id	street	customer_state	customer_email_id	customer_password	customer_city	customer_first_name	customer_last_name
1	Aarti	Joshi	park street	389000	Gujarat	AJoshi@xyz.com	9899975500	AJoshi	Hyderabad

11	Falzu	Godswala	exotic park	389010	Assam	FGodswala@xyz.com	9899975510	FGodswala	amritsar

Now for insert/update/delete or many more functionalities there are edit table option that is clearly shown in below images. Here we are giving the example of insert the new recommendation in recommendation table.

## Initial Recommendation table (Before Insertion operation):

customer_id	service_name
1	Relocation ready Home
2	Tourist Guide
3	Automobile repairs
4	Relocation ready Home
5	Tourist Guide
6	Relocation ready Home
7	Interior designer
8	Automobile repairs
9	Tourist Guide
10	Transportation
11	Automobile repairs
12	Transportation

## For Insertion:

We have to write the information based on the table and submit that information

customer\_id: 99  
service\_name: Cloth\_expert

## Updated Recommendation table (After Insertion operation) in Postgres and webpage too:

Select Table

customer_id	service_name
99	Cloth expert
95	Tourist Guide
95	Automobile repairs
91	exterior designer
78	Relocation ready Home
68	Tourist Guide
68	Transportation
51	Automobile repairs
49	Tourist Guide
35	Transportation

Showing 1 to 10 of 13 entries

Webpage Recommendation table

```
1
2 select * from recommendation
3
```

customer_id	service_name
1	5 Relocation ready Home
2	95 Tourist Guide
3	27 Automobile repairs
4	13 Relocation ready Home
5	49 Tourist Guide
6	78 Relocation ready Home
7	91 exterior designer
8	51 Automobile repairs
9	68 Tourist Guide
10	35 Transportation
11	95 Automobile repairs
12	68 Transportation
13	99 Cloth expert

Successfully run. Total query runtime: 38 msec. 13 rows affected.

Postgres Recommendation table

### For Custom Query:

If we have to run some query operation then we don't need to go to the Postgres SQL we can directly run from the custom query option of the webpage. The example of this functionalities is given below by the snapshot.

The screenshot shows a web-based MySQL query interface. At the top, there are several tabs: 'Custom Query', 'WhatsApp', 'HTML & target Attribute', 'SQL INSERT INTO Statement', 'MySQL - DELETE Query', and others. Below the tabs, there are three buttons: 'Show Table', 'Edit Table', and 'Custom Query'. The 'Custom Query' button is currently selected. A red box highlights the input field containing the SQL query: 'Select \* from services where service\_id%2=0'. Below the input field is a green 'Submit' button. The main area displays a table with the following data:

2		Painter	200	20
4		Plumber	500	120
6		Makeup Artist	500	120
8		AC service/repair	800	60
10		SPA	400	120
12		Repair/Maintenance	600	200
14		Party Management	1000	120
16		Yoga Instructor	200	80
18		Carpenter	500	100
20		Interior designer	500	100
